Primobolan is appropriate to those clients who don't care for the aromatase impacts of steroids as Primobolan like most DHT steroids don't aromatize. Methenolone is the dynamic hormone in both the oral and injectable forms of Primobolan. The oral form will be less gripping than the injectable form because of mode of availability in body.

I'm really just sharing this in the event any of you are feeling like me. If you need a little accountability, some encouragement and to know someone else out there is struggling to get started again (for the millionth time), know, I'm with you ☐! It's hard, it really sucks at first but I know it's also totally worth it!

Primobolan is a very powerful cutting agent, but not that useful as a bulking steroid. It binds closely to the androgen receptor and speeds up the process of burning fat. It acts as a binding agent as well as a cutting agent and is one of the best anabolic steroids to take for the cutting phase.

The oral version of Primobolan is known as Methenolone Acetate. As previously mentioned, this compound has a shorter half-life than the injectable primo. The half-life of this compound is between 4 to 6 hours. Methenolone Acetate is the only oral steroid that is non 17-alpha-alkylated.
