How to Grow Sprouts **(Basket Method)**

Sprouting requires approx. 2 minutes per day, mostly rinsing in the morning (breakfast) and evening (dinner), 12 hours apart. A third rinse, particularly in hot weather, is ideal.

For each batch (basket):

I Soaking phase:

Fill a 500 ml jar ½ full of (cold) water.

If you are on well water: Add 7-8 drops of food grade Hydrogen Peroxide (35% solution).

You have now created an 3% dilution.

Add 2 Tbsp seed. Place screen, cheesecloth or lid in place on jar.

Let soak (see below for soaking times for seeds):*

II Jar Rinsing Phase (Days 1-3):

At end of soaking time, drain off water, turn jar on 45 degree angle to continue draining.

(Place in bowl or dish rack. Be careful not to let the seed block the mouth of the jar too much; sprouts need ventilation.)

Let drain for 8-12 hours.*

Fill jar with cold water. Gently agitate for a couple of seconds. Drain immediately.

Repeat (fill, drain) for the next 48 hours.

**Rinse in 8 or 12 hour cycles; breakfast and dinnertime works best.*

Rinsing greater than 12 hours apart will result in seed drying out.

Rinsing 3 x per day is ideal.

III Basket Rinsing Phase (Days 4-7):

Place basket on counter or in cupboard.

Fill jar with water.

Shake gently to loosen any seeds stuck to the screen.

Remove screen (or cheesecloth).

Place basket in the sink.

Empty jar into basket.

Continued...

To evenly spread seed around:

(without handling the seeds, which can damage them, causing them to rot)

Use the "panning for gold" technique:

Fill a bowl (slightly bigger than basket) with water.

Immerse basket. Seed will float.

Gently even the seed out with your hand.

a) Day 4: Dome on:

Lift basket out of the water. Place in plastic drip tray. Cover with dome.

Continue to rinse every 12 hours (minimum), replacing dome each time.

(For continuous supply of sprouts, begin soaking next batch of seed on day 5.)

b) Day 5: Place dome ½ on:

Continue to rinse every 12 hours (minimum).

c) Day 6 & 7: Remove dome:

Continue to rinse every 12 hours (minimum).

If you want greener sprouts (more chlorophyll):

Place basket near window (no direct sunlight), or under grow-lights.

to remove hulls: Turn basket upside-down and rinse.

IV Harvesting:

Gently grab a clump of sprouts, wiggle and pull out.

Place sprouts in an airtight container in fridge.

Sprouts will keep for a week or more.

To clean basket:

Pull out most of the sprout bits.

Let dry upside-down (1/2 day).

Using dry brush, gently brush off dry sprout bits.

Place in dishwasher or hand wash. (Plastic dome and tray must be hand washed.)

***Seed soaking times (there are exceptions; consult a book on sprouting for more info):**

1-2 hours: Broccoli

3-5 hours: small seeds (alfalfa, radish, garlic chives, clover, fenugreek),

8-12 hours: Grains, peas, sunflower, and other big seeds

(Grains, such as wheat, barley, spelt, oats, kamut, etc., are not grown in baskets.)

Sprouting seeds must be organic and high germination.
