

Thanks For Purchasing!!

Of course you know your press but just in case...

Below are a few instructions or tips for installing:

****The NEW spring is not designed to work with the original bushing****

- 1- Apply a slight amount grease(bearing or axle) to the inner wall of the NEW stainless steel bushing up to its mouth, as to prevent squeaking and wear from the spring rubbing against the stainless steel.
- 2- Once OEM bushing and toolhead spring are removed install the new Stainless Steel bushing
- 3- Install the NEW spring onto the toolhead, ensure the spring enters into the hole completely. A little force and/or turning the spring counter-clockwise may be needed.
- 4- Once the toolhead bolt is ready to be tightened ensure proper alignment of toolhead to press main body.

*Be aware some presses have a natural slight twisting motion when cycled and can cause the spring to rub the bushing mouth on the first $\frac{1}{4}$ part of the down stroke or so.

Hope you enjoy the many cycles this new Spring and Bushing Kit will provide!!

Feel free to share any concerns or questions you may have.
