

# The FlexiStack Rubber Border System Is Easy To Install

The Inter-Locking systems overlap and is held securely in place with a stake through the middle. This allows you to pivot the angle of each border in any direction. Each border covers a linear length of 42". You can even end your border with an additional "end cap" and stake.

To increase the height of your border simply stack and inter-lock a boarder on top of the first row to create a total height of 8.25". We recommend an additional stake in the middle of the border and an "end cap" if not connecting to another border.

## How Many Borders Will You Need?

Step 1. Determining the total linear length of your border space:

Once you establish your space you are "framing" with borders, measure in inches the length of each side of the space. Add the lengths together and you have your total linear length in inches. (Tip: If your shape has curves you can use a garden hose to create your shape and then measure the length of the garden hose used.)

Step 2. Determining the quantity of borders required:

Each rubber border has a linear length of 42". (The total length of each border is 48" with an over-lapping inter-locking system.) Divide your "total linear length" (Step 1), by 42" and the total is the quantity of borders you'll need.
