YOUR DOG'S REPORT

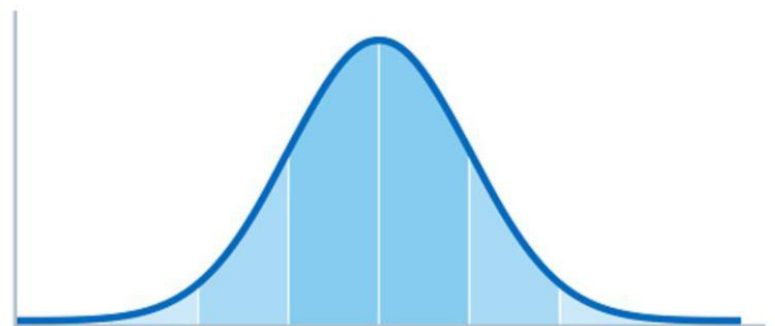

How does our test work?

We have developed a test that measures changes to your dog's DNA that occur as they age. These changes are based on epigenetic modifications to a dog's DNA. Using a special type of DNA sequencing we can "read" these modifications and from that infer the age and traits of your dog.

How old is your dog?

We estimate that your dog is 13 years and 11 months old. Based on the accuracy of our measurement we are confident that the age is between 13 years and 5 months and 14 years and 5 months.

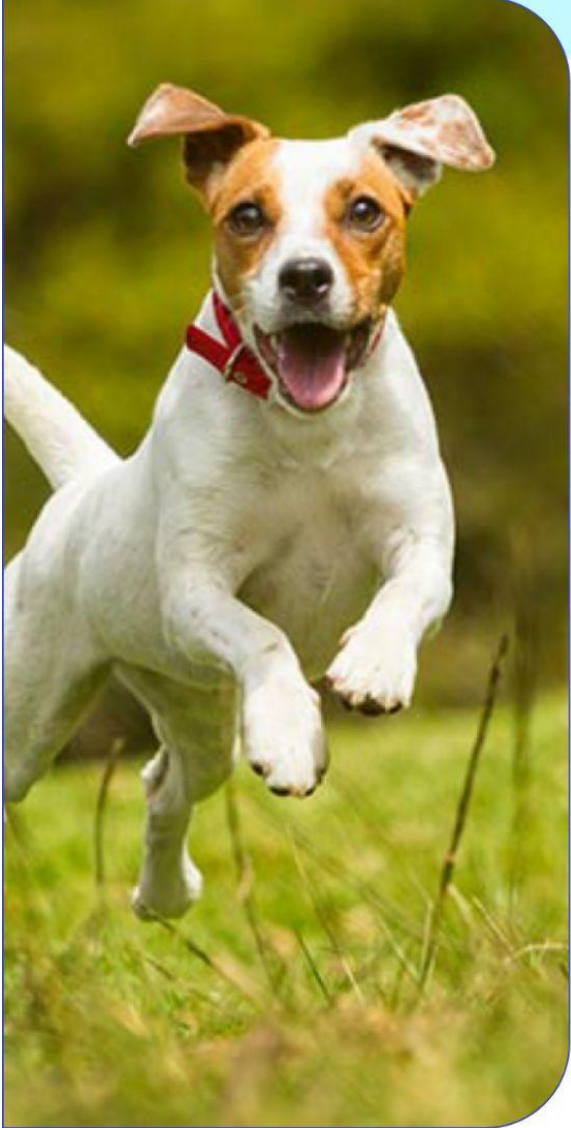

13 years

What type of behaviors does my dog's DNA predict?

Based on your dog's epigenetics we predict that they are likely to have the following behavioral tendencies:

Energy:

We predict your dog has medium energy levels (bottom 34% of dogs)

Attention:

We predict your dog has low levels attention levels (bottom 10%)

Stranger directed fear:

We predict your dog has low levels of stranger directed fear (bottom 28%)

You can find more information about these behaviors [here](#).

What else can we learn about your dog?

We plan to soon start selling our dog oral microbiome test.

This test will allow you to work with your veterinarian to maintain your pup's oral hygiene
