

Overlap Reducer

Installation: Glue - Overlap Reducer overlaps the flooring and is glued to the substrate using a high-grade construction adhesive.

Purpose/Application: This transition is used to gradually reduce the height of the hardwood flooring down to substrate level, vinyl or VCT. It also provides another solution for going around fireplace hearths that are lower than the flooring. Sometimes it can be used as a transition from tile or other taller flooring materials to the wood/bamboo flooring. This can be done by removing part of the reducer portion to adjust the thickness, and butting that portion to the other material.
