

T-Molding

Installation: Glue - Glue down in between two solid level flooring surfaces to cover the expansion space on both sides.

Purpose/Application: This transition is used to join two materials that are exactly the same height to hide the expansion gaps. It is mainly or primarily used to separate two rooms so that the different expansion rates will not affect the adjoining rooms. Under some circumstances, you may be able to shim one side so that it sits firmly on the surface. Be aware that if this transition does not sit firmly on both surfaces, it will likely crack, and eventually break.
