Operating Instructions for Drills

PLEASE READ AND FOLLOW ALL WARNINGS

GENERAL INFORMATION-

Use of a 3/8" air hose is recommended. Use the fewest number of quick disconnects possible to minimize air pressure drop. Air pressure at the tool should be 90 PSI or less. Using the least amount of pressure possible will allow you to get the maximum life from your tool. Small air compressors with tanks under 20 gallons may not provide enough air to maintain a constant 90 PSI.

Using too much air pressure is like driving your car at 200 MPH. Your car may go that fast, but will the tires, engine and bearings hold up? Excess air pressure can cause premature wear or tool failure. Never drag a tool by the air hose, doing so can bend the rotor shaft causing permanent damage. Always check a drill, if it is dropped, for damage to the bit or a bent rotor shaft. The size of the hole you are drilling dictates the speed of the drill you need to use. Use slower speed drills for steel and higher speed drills for aluminum. To keep dirt and grinding dust out of your tools, store them in plastic ziplock bags after oiling. If you have specific questions call us at 800-805-8665.

1. ALWAYS DISCONNECT THE TOOL FROM AIR SOURCE WHEN CHANGING ACCESSORIES OR SERVICING THE TOOL.
