T-7892N 1/4" Heavy Duty Riveter

OPERATING INSTRUCTIONS FOR THE T-7892N RIVET TOOL (RED)

Always disconnect tool from air source before servicing!!

- 1. Maintain fluid levels Use 30 wt. non-detergent oil. Mount tool in vice with bottom cap #35 up. Remove #35 with wrench #55. Remove entire piston (part #29, 31, 32, 33) as an assembly, by grasping #33 with a pair of pliers and pulling straight up. After the piston is removed, fill with 30 weight non detergent oil to 1/2" below #40 nut (no oil should be in the #39 cylinder). Lightly grease #31 and#34. Replace piston and #35 cap, and remove tool from the vice. Now the tool is ready for use. The total amount of oil should be about 2-1/2 tablespoons. A few drops of 30 wt oil or air tool oil through the air inlet every 10 to 15 minutes is recommended if no air line oiler is in place.
- 2. Adjusting the stroke Remove #02 by using #55 wrench. For maximum stroke, loosen nut #08 and thread the nut all the way onto #17 piston. Then loosen #03 and #07 and thread them all the way to #08. Hold #08 with a wrench and tighten #3. For a shorter stroke, adjust #08 so that it is away from the shoulder of #17 by two or more threads, depending on how short you want the stroke to be.
- 3. Always use the correct size nosepiece for the rivet you are using. It is a good idea to use a silicone oil such as WD-40 to lubricate the jaws(#04) when pulling quantities of rivets, as there may be a build up of metal particles that could cause mandrels to stick in the jaws.
- 4. Air pressure The maximum pressure should be 90 PSI. A higher pressure could cause damage to your tool. Using the lowest pressure possible for your application will extend the life of your tool dramatically.
- 5. As with all tools, make sure that all parts are tight from time to time, as vibration from use may loosen components.
- 6. Mandrels The T-7892N comes complete with the #22 mandrel catcher. Once a rivet has been popped and the next rivet is mounted in the nosepiece, the last mandrel will slide into the #22. To remove mandrels, turn the tool upside down and they will fall out of the slot in #22, or remove #22 completely and empty.

USE 90 PSI MAXIMUM
