WHAT IS CYANOSIS?

Cyanosis is a medical term referring to skin and/or membranes turning bluish/purplish. It is an indication that the tissue near the skin/membranes is low on oxygen saturation. It is therefore a visual manifestation of a whole range of potential cardiac or respiratory problems and is a symptom that medical professionals are trained to look for.

HOW DOES LIGHTING HELP?

Because cyanosis is a visual cue of a medical symptom based on observable colour, lighting conditions and light quality play a significant part in its visual detection. The detection of a 'bluing' of the skin depends largely on the accurate rendition of both 'normal' skin tones and blue hues.
