RB SERIES AVAILABLE OPTIONS

1. ABS Cash Box

The ABS cash box makes servicing quicker and easier. With the ABS plastic bottom, the body becomes a box allowing coins to be dumped as opposed to scooping coins out of the base by hand.

3. New Generation 1 Coin Mechanism

The New Generation 1 coin mechanism has set the world standard for rotary coin mechanisms. It incorporates the security of the clutch handle with the ability to measure coins accurately for diameter and thickness, ensuring vends only when the correct denomination of coin is used. Most coins and tokens of smaller diameter will pass through to the cash box. It also accepts tokens or currency for over 100 countries.

2. Clutch Handle for Standard Mechanism

This handle is maintenance free and will prevent users from forcing free vends. The clutch handle is designed to spin in either direction when forced, so that product is not dispensed and damage to the internal components of the coin mechanism is prevented.

4. New Generation 2 Coin Mechanism

With the New Generation 2 coin mechanism you are able to vend for two coins. Each coin can be a different value. This mechanism incorporates the security of the clutch handle and the ability to accurately measure coins for diameter and thickness, ensuring vends only when the correct denomination of coins is used. Most coins and tokens of smaller diameter will pass through to the cash box. It accepts tokens or currency for over 100 countries.

5. New Generation 3 Coin Mechanism

The New Generation 3 coin mechanism vends product for 3 coins such as 75 cents. This mechanism also has the security of the clutch handle with the ability to measure coins accurately for diameter and thickness to ensure that product is only dispensed for the correct coins. Most coins and tokens of smaller diameter will pass through to the cash box. This mechanism also accepts coins from over 100 countries.

6. New Generation 4 Coin Mechanism

The 4 coin New Generation coin mechanism vends product for 4 coin combinations such as \$1.00 US. With the security of the clutch handle and the ability to measure coins accurately for diameter and thickness, this mechanism helps to ensure that product is only dispensed for the correct coin combinations. Most coins and tokens of smaller diameter will pass through to the cash box. This mechanism also accepts coins from over 100 countries.

RB SERIES OPTIONS CON'T

7. Ferrous or Non Ferrous Single Coin Mechanism

The standard ferrous coin mechanism increases your profits as it rejects plastic and cardboard slugs while accepting metal coins. The non-ferrous coin mechanism minimizes the number of free vends by rejecting steel slugs while accepting non-magnetic coins such as American coins.

9. Chrome Chute Tray

The chrome spill tray keeps locations clean. When the door of the vending machine is opened and the product is not caught, this tray keeps most products from falling on the floor.

11. EZ Count® Counter on Coin Mechanism

The EZ counter saves time when servicing and minimizes counting error. Every complete turn of the mechanism handle is registered on a digital read out.

Available in re-settable or non re-settable format.

8. Tubular Key & Lock

The tubular locks, which screw down flush with the top of the lid, adds heightened security to your vending machine. The tubular lock makes it virtually impossible to break into with a screwdriver. Like our flat locks, these tubular locks are geographically assigned for your security.

10. Microswitch on NG Coin Mechanism

Mounting a micro switch on an NG mechanism allows for the activation of an electronic device on the machine, such as lighting, a game, or sound each time a product is dispensed. The micro switch facilitates an electronic signal which can be read by these devices.

12. Base Collar

The metal base collar, bolted to the base of the machine, lines the ABS plastic body on the inside for added security as well as ease of servicing. To service the machine, just unlock the lid, lift and turn the body resting it on the collar. Coins are now easily accessible; just scrape the coins out through the large opening in the front of the collar.

RB SERIES OPTIONS CON'T

13. Cash Drawer - Pull Tab

The cash drawer minimizes servicing time and makes servicing easy. This drawer allows the coins to be retrieved by removing the locked drawer under the machine rather than having to disassemble the entire machine. Available in a durable black powder coated finish or in a brilliant triple chrome plated finish.

14. Security Lid

The security lid drawer has the ease and efficiency of the standard cash drawer, with the added security of a lid on top of the cash. Without the cash drawer key, the cash cannot be accessed.

15. Lockable Security Lid

The lockable security lid drawer has the ease and efficiency of the standard cash drawer with the added security of a lockable top. Simply exchange a full cash drawer for an empty one. The cash can only be accessed by the security lid key holder.

Bottom view of lockable security lid

16. RB23 Extended Globe

Includes:

- Globes
- Center rod
- Side rods
- Coupling ring
- Locator ring

This feature, while increasing the height of the machine from the standard 16" to 23", offers an additional 95% capacity. This extended globe is great in high traffic locations. The RB23 globe is the largest capacity for the RB series machines. Easily retrofitted from standard models.

RB SERIES OPTIONS CON'T

17. RB18 Extended Globe

Just slightly taller than the standard 16", this feature offers an additional 25% capacity. Easily retrofitted from standard models.

20. Metal Capsule Gum/Toy Wheel

Some products tend to stick to the nylon wheel. Use of the metal wheel eliminates this problem and offers operators trouble free vending.

23. Mechanism Prepped for Micro-Switch

The New Generation coin mechanism can be prepped for micro-switch mounting. By pre-drilling the correct holes, the micro-switch can be easily screwed on at a later date.

18. Weighted Chute Door

When vending most large quantities or heavier products, the weighted door remains closed until it is opened by hand. This door is triple chrome plated for durability.

21. Metal Pipe to Vend Bouncy Balls

This 1 5/8" metal pipe, placed over the stem of the spider agitator, increases the diameter of the stem, preventing the product from bridging. This will result in consistent vends and less service calls.

24. Bent & Sharpened Washer Dog

If cardboard and plastic slugs are a constant source of lost revenue, this bent and sharpened washer dog will help to eliminate most of those free vends.

19. Lid Lock Boot

Placed around the bottom of the lock shaft, the boot helps to seal out moisture, keeping product fresher. This is a very useful feature when dispensing product such as fish food that will clump when exposed to moisture.

22. Cut Wing

The cut metal wing for the adjustable conversion allows more consistent product portions to be dispensed with one vend. It is useful when dispensing large candies such as m&m's peanut and mike & ikes.

25. High Capacity Adjustable

This high capacity adjustable bulk conversion allows you to vend m&m's, chicklets, nuts and animal feed in large quantities. This conversion also allows you to control portion sizes without disassembling the machine. A special adjustment tool is supplied.
