

Photo Contrastors

The **doctorseyes Contrastors** are an excellent tool for obtaining the best occlusal and front teeth shots. The obscure unnecessary detail and contrast is increased, thereby offering an overall more professional result.

Presentation quality images can be obtained using our **anterior Contrastor** set.

The handles of the **Contrastors** are the same as those on our intraoral mirrors, allowing the patient to hold them comfortably in place.

The **occlusal Contrastor** has been designed to facilitate occlusal mirror views because the curved end lifts the lip away. The innovative design blocks the appearance of nostrils, lips and moustaches.

The 'handles' can also be used to 'block out' the background in lateral views. The **Occlusal Contrastors** is available in both adult and child sizes.

NEW!

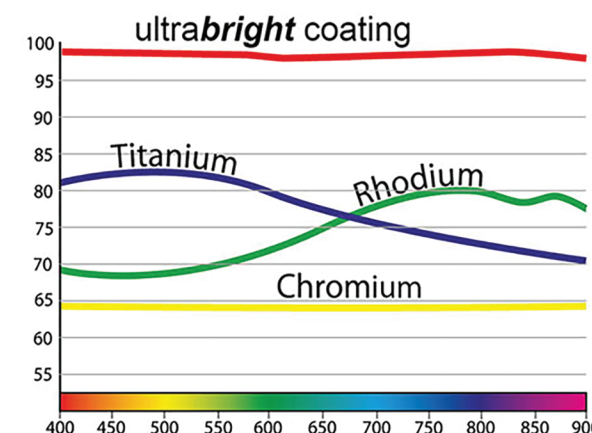

ultrabright II mirrors

doctorseyes presents a new generation of **dental mirrors**, which leaves the rest of the mirrors in the dust. With the groundbreaking ultra bright coating one can for the first time achieve close to 100% reflectivity. Even high-grade rhodium and titanium mirrors have only reached an average 75% reflectivity until now; the traditional chromium plated mirrors achieve about 65%. The mirrors come with a removable silicon handle for comfortable handling which also can be autoclaved together with the **mirror**.

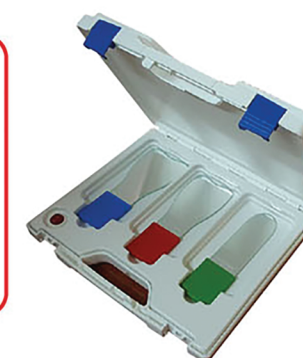

With thorough testing the mirrors have been shaped and perfected for optimal use. Our **unique mirror forms** were created based on the best possible combination of reflection surface, safe handling and comfort. For making occlusal overviews we have created three different sizes.

For buccal and lingual shots we designed specially optimized shapes. For orthodontic images we offer our **occlusal and buccal mirrors** also in sizes which are suitable for children.

Mirrorsafe New Product

The Mirrorsafe, Is Designed to warm All kinds of Intraoral Mirrors up to body Temperature .

The **doctorseyes ultrabright II mirrors** have a new technologically improved coating. This new generation of mirrors utilizes a very complex coating process. Most Rhodium and Titanium coated mirrors have only two layers of reflective coating whereas the new ultrabright II has 108 layers.

These layers are applied with a new plasma operation and vacuum-metalized by means of a richly energized metal ion reaction. This new technique of coating delivers an even higher reflective capability and a better mechanical resistance.

new **ultrabright II** coating with 108 layers
