Details

Target Description	The Kv channel-interacting proteins (KChIP1, kChIp2, kChIp3, and kChIp4) are members of the family of voltage-gated potassium (Kv) channel-interacting proteins (KCNIPs), which belong to the recoverin or neuronal calcium sensor (NCS) family branch of the EF-hand superfamily. They serve as auxiliary channel subunits and interact with Kv4 alpha subunits to form native Kv4 channel complexes. KChIP subunits regulate Kv4 channels through various mechanisms including altering: channel density, inactivation kinetics, rate of recovery from inactivation, and cell surface delivery.
Specificity	No cross-reactivity reported
Purification Method	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
Quality Control Tests	Each new lot of antibody is quality control tested by western blot on rat whole brain lysate and confirmed to stain the expected molecular weight band.
