Details

Target Description	Ankyrin-2 or -Ankyrin-B is encoded by the gene ANK2. Ankyrin B is a scaffold protein that functions to link proteins that mediate the attachment of integral membrane proteins to the spectrin-actin based membrane cytoskeleton. In this manner, ankyrin family proteins play key roles in various processes including cell motility, activation, proliferation, contact and the maintenance of specialized membrane domains. Ankyrin B is expressed in brain and muscle. Mutations in this gene cause long QT syndrome 4 and cardiac arrhythmia syndrome.
Specificity	No cross-reactivity reported
Purification Method	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
Quality Control Tests	Each new lot of antibody is quality control tested by western blot on rat whole brain lysate and confirmed to stain the expected molecular weight band.
