## Details

<b>Target Description</b>	QKI5 is a member of the Signal Transduction and Activation of RNA proteins (STAR proteins) family. QKI5, QKI6 QKI7 and QKI7b are alternatively spliced mRNAs from the QKI1 gene. QKI5 is a RNA-binding protein. QKI5 has roles in the regulation of splicing, export and stability of mRNA. It is involved in myelination. It is a nuclear isoform and contains a C-terminal nuclear localization signal. Diseases associated with this gene include Angiocentric Glioma, 6Q Terminal Deletion Syndrome .and Schizophrenia.
<b>Specificity</b>	Does not cross-react with QKI-6, QKI-7 or QKI-7bCross-reacts with other STAR proteins containing similar nuclear localization signals
<b>Purification Method</b>	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
<b>Quality Control Tests</b>	Each new lot of antibody is quality control tested by western blot on rat whole brain lysate and confirmed to stain the expected molecular weight band.
