Details

Target Description	Actin Like 6B, of BAFcomplex 53 KDa Subunit (BAF53b) is encoded by the gene ACTL6B and is a member of actin-related proteins family. It is a subunit of the neuron specific chromatin remodeling complex (nBAF complex). ACTL6B plays a role in remodeling mononucleosomes in an ATP-dependent fashion, and is required for postmitotic neural development and dendritic outgrowth. Diseases associated with ACTL6B include Early Infantile Epileptic Encephalopathy 76 and Intellectual Developmental Disorder with Severe Speech and Ambulation Defects.
Specificity	Does not cross-react with BAF53a
Purification Method	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
Quality Control Tests	Each new lot of antibody is quality control tested by IHC on either rat or mouse brain and confirmed to give the expected staining pattern.
