Details

Target Description	Gamma-aminobutyric acid receptor subunit alpha-2 or GABA AR-Alpha2 is encoded by the gene GABRA2. GABAA receptors are members of the Cys-loop family of ligand-gated ion channels. GABA AR alpha 5 is a subunit of the pentameric GABA receptors where GABA is the major inhibitory neurotransmitter in the vertebrate brain and mediates neuronal inhibition by binding to the GABA receptor and opening an integral chloride channel. GABA AR-Alpha2 is primarily expressed in brain at the cell junction, synapse, and the postsynaptic cell membrane. Diseases associated with GABRA2 include Alcohol Dependence and Alcohol Use Disorder.
Specificity	Does not cross-react with GABA-A-R-Alpha1
Purification Method	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
Quality Control Tests	Each new lot of antibody is quality control tested by western blot on rat whole brain lysate and confirmed to stain the expected molecular weight band.
