Details

Target Description	The β subunits of voltage-gated potassium channels are members of the potassium channel, voltage-gated, shaker-related subfamily. Kv β s are cytoplasmic subunits that modulate the characteristics of the membrane spanning, channel-forming alpha-subunits. Beta subunits can promote the closure of channels or enhance channel activity depending on other channel proteins. There are three β subunits (Kv β 1, Kv β 2, Kv β 3) which are coded by three different genes. Additionally, there is alternative splicing of these three genes, further diversifying the functions and tissue expression of the family.
Specificity	Reacts with Kvbeta1
Purification Method	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
Quality Control Tests	Each new lot of antibody is quality control tested by western blot on rat whole brain lysate and confirmed to stain the expected molecular weight band.
