## Details

<b>Target Description</b>	Gamma-aminobutyric acid receptor subunit epsilon or GABA AR epsilon is encoded by the gene GABRE. GABA A receptors are members of the Cys-loop family of ligand-gated ion channels. GABA AR epsilon is a subunit of the pentameric GABA receptors where GABA is the major inhibitory neurotransmitter in the vertebrate brain and mediates neuronal inhibition by binding to the GABA receptor and opening an integral chloride channel. GABA AR epsilon is found expressed in many tissues including adult heart, placenta and adult brain. In brain, GABA AR epsilon is expressed at the cell junction, synapse, postsynaptic cell membrane and cytoplasmic vesicle membrane.
<b>Specificity</b>	No cross-reactivity reported
<b>Purification Method</b>	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
<b>Quality Control Tests</b>	Each new lot of antibody is quality control tested by western blot on rat whole brain lysate and confirmed to stain the expected molecular weight band.
