## Details

<b>Target Description</b>	Vesicular monoamine transporters (VMATs) sequester neurotransmitters such as dopamine, serotonin and adrenaline into synaptic vesicles (Erickson et al., 1996). Two VMATs have been identified, VMAT1 and VMAT2. VMAT1 shows a higher affinity for serotonin (Brunk et al., 2006). Antibodies specific for VMATs have been used to monitor expression of the transporter during development and in aging and can be effectively used as a marker for monoamine terminals (Haycock et al., 2003; Witkovsky et al., 2005).
<b>Specificity</b>	Does not cross-react with VMAT2
<b>Purification Method</b>	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
<b>Quality Control Tests</b>	Each new lot of antibody is quality control tested by IHC on either rat or mouse brain and confirmed to give the expected staining pattern.
