## Details

<b>Target Description</b>	Glutamate decarboxylase 1, GAD67 or GAD1 is a member of the group II decarboxylase family and catalyzes the production of GABA from L-glutamic acid. GAD67 is expressed in brain (throughout the cell), in insulin producing $\beta$ cells of the pancreas, and several non-neuronal tissues during development. Alterations in GAD67 have been shown to lead to pyridoxine dependency with seizures. Other disorders associated with GAD67 are Cerebral Palsy, Spastic Quadriplegic, 1 and Inherited Congenital Spastic Tetraplegia.
<b>Specificity</b>	Cross-reacts with GAD25 Does not cross-react with GAD44 or GAD65/GAD2
<b>Purification Method</b>	Produced by in vitro bioreactor culture of hybridoma line followed by Protein A affinity chromatography and conjugation of purified mAb. Purified mAbs are >90% specific antibody.
<b>Quality Control Tests</b>	Each new lot of this antibody is tested to confirm that it recognizes a single immunoreactive band of expected molecular weight when used to probe brain lysate.
