

Tolerances

The series |chamfer| is a static miracle. The design enables the furniture to adapt to the surfaces and loads like a skeleton. Each strut and screw serves its purpose to create a delicate yet highly resilient piece of furniture.

If your furniture should wobble due to unforeseen tolerances or an uneven underground, you have the possibility to balance the construction with the washers.

Set up furniture and determine feet that are not touching the floor. Usually these are two diagonally opposite.

Loosen the wing screws on these feet and slide a washer under the arrow-shaped contact surface.

Then, as usual, screw the wing screw through the arrow-shaped contact surface and the washer into the Neolign plate.

It is best to turn the piece of furniture over with two people. For a firm stand, align the legs outwards in all four directions.
