

NOTICE TO DRY CLEANER

Please pay particular attention to the items mentioned below in the care and handling of the new DeMoulin garments. We encourage you to read thoroughly the dry cleaning information enclosed. To assist you further we have listed below several major considerations for the cleaning of these garments. Please telephone us at any time if you have questions or need further assistance.

1. The temperature of solvent should never exceed 85⁰ Fahrenheit.
2. Moisture should remain at a low level. Excess moisture within the cleaning system can result in color migration.
3. Load capacity should be cut in half. Example: A 40 unit cleaning system should clean only 20 uniform units per load. This is especially important if uniforms have been subjected to inclement weather conditions or have become extremely soiled.
4. Check sight glass to insure proper filtration at all times.
5. Please call us toll free for any assistance:
