

1 Mount **Base** into vent opening. Fasten with screws as needed.

2 Measure base of ventilation fan to check if adjustments need to be made to the **Flush Exhaust Mount** opening.

3 Measure **Body**. If adjustment is necessary, cut along perforated edges according to sizes in step #2.

4 Some fan flanges can obstruct holes needed to slide on the **Tray** (step 9). If this is the case, trim flanges of fan.

5 Peel and stick provided sound dampening strips along the edges of the opening.

6 Insert and fasten fan with screws. Sound dampening strips should be sandwiched between fan and **Body**.

7 Use mud to cover flange surfaces. Wait to dry, then sand. Repeat as needed.

8 Paint inside of the **Body** and **Tray** to match ceiling colour. Do not paint fan.

9 Insert and slide **Tray** into place. Use hole on the side of the **Tray** as a guide.

10 Enjoy!
