### Overview of Mac OS X El Capitan on Virtualbox on Windows

The power technologies in OS X El Capitan were built with the capabilities of recent processors and therefore the demands of recent apps in mind. The new power technologies work together to realize substantial power savings while maintaining—and in some cases even improving—the responsiveness and performance of your Mac.

These technologies are rooted during a few key principles:

#### Os X Version 10.11 Download

- Just work for existing apps. No changes to applications should be needed, though small changes may facilitate additional power savings.
- Keep as many processor cores idle as possible given the demand for CPU.
- When on battery power, only work that the user is requesting or that's absolutely essential.

#### USB Power Management

Traditionally, USB device power management is completed manually, with a function driver making explicit suspend or resume calls on a USB device service. This is often error-prone and leads to overly complex driver code to manage the power state.

USB in OS X El Capitan has been completely implemented to profit from an equivalent USB architecture and aggressive power management policy adopted by iOS. Each endpoint in a device is often given an idle timeout in milliseconds, and an endpoint is taken into account idle if a lively transfer hasn't completed within that timeout. The device has an idle state also, which may be a logical AND of the idle state for the endpoints related to the device. Only the device idle timeout expires does the OS pause I/O on the bus and electrically suspend the device at the port.

The idling system is a crucial advance because drivers don't have to actively participate in power state transitions.

#### System Integrity Protection

System Integrity Protection may be a policy introduced in OS X El Capitan to assist prevent malicious software from performing harmful actions on your Mac. System Integrity Protection prevents software from modifying files and folders owned by the system, albeit the software is run because of the administrator or with root privileges.

Examples of paths within the filing system that are protected include the following:

- System folder
- /bin/
- /sbin/
- /usr/ (with the exception of /usr/local/)

In addition, System Integrity Protection prevents modification of applications and utilities that are installed with OS X and prevents changes to your boot volume without your data.

#### Data Compression

Four different compression algorithms are supported, giving developers a choice between speed, compression ratios, and interoperability with non-Apple devices.

#### LZ4

LZ4 is a particularly high-performance compressor. OS X implements encoder support at level 6 only. It uses a dictionary compression scheme and features a high compression ratio and a variable compression dictionary size.

#### ZLIB

**ZLIB**

Zlib may be a lossless data compression library to be used on a spread of operating systems. OS X implements a ZLIB encoder at level 5, which provides an honest balance between compression speed and compression ratio.

Following are the installation along with the interfaces steps:

**Mount Installer DMG record to macOS**

- hdiutil interface/Applications/Install OS X El Capitan.app/Contents/SharedSupport/InstallESD.dmg – no verify – no browse – mount point/Volumes/Install

**Make a DMG Disk**

- hdiutil make – o/tmp/elcapitan – size 7900m – volname elcapitan – design SPUD – fs HFS+J # hdiutil affix/tmp/elcapitan.dmg – noverify – mountpoint/Volumes/elcapitan

**Copy Installer to new Disk**

- asr restore – source/volumes/Install/basesystem.dmg – target/Volumes/elcapitan – no prompt – no verify – erase
- # rm/Volumes/OS X Base System/System/Installation/Packages

**Download Mac OS X El Capitan on Virtualbox on Windows**

You can download the Mac OS X El Capitan on Virtualbox on Windows by accessing the link below. Also, make sure that you have enough back up before you proceed with the same. There are a lot of duplicate ISO images on the market and it is best to download the same from a trusted source.

So, you’ve decided to download an older version of Mac OS X. There are many reasons that could point you to this radical decision. To begin with, some of your apps may not be working properly (or simply crash) on newer operating systems. Also, you may have noticed your Mac’s performance went down right after the last update. Finally, if you want to run a parallel copy of Mac OS X on a virtual machine, you too will need a working installation file of an older Mac OS X. Further down we’ll explain where to get one and what problems you may face down the road.

**A list of all Mac OS X versions**

We’ll be repeatedly referring to these Apple OS versions below, so it’s good to know the basic macOS timeline.

Cheetah 10.0	Puma 10.1	Jaguar 10.2
Panther 10.3	Tiger 10.4	Leopard 10.5
Snow Leopard 10.6	Lion 10.7	Mountain Lion 10.8
Mavericks 10.9	Yosemite 10.10	El Capitan 10.11
Sierra 10.12	High Sierra 10.13	Mojave 10.14
Catalina 10.15		

**STEP 1. Prepare your Mac for installation**

Given your Mac isn’t new and is filled with data, you will probably need enough free space on your Mac. This includes not just space for the OS itself but also space for other applications and your user data. One more argument is that the free space on your disk translates into virtual memory so your apps have “fuel” to operate on. The chart below tells you how much free space is needed.

Note, that it is recommended that you install OS on a clean drive. Next, you will need enough disk space available, for example, to create Recovery Partition. Here are some ideas to free up space on your drive:

- Uninstall large unused apps
- Empty Trash Bin and Downloads
- Locate the biggest files on your computer:

*Go to Finder > All My Files > Arrange by size*

Then you can move your space hoggers onto an external drive or a cloud storage.

If you aren’t comfortable with cleaning the Mac manually, there are some nice automatic “room cleaners”. Our favorite is CleanMyMac as it’s most simple to use of all. It deletes system junk, old broken apps, and the rest of hidden junk on your drive.

## STEP 2. Get a copy of Mac OS X download

Normally, it is assumed that updating OS is a one-way road. That's why going back to a past Apple OS version is problematic. The main challenge is to download the OS installation file itself, because your Mac may already be running a newer version. If you succeed in downloading the OS installation, your next step is to create a bootable USB or DVD and then reinstall the OS on your computer.

### How to download older Mac OS X versions via the App Store

If you once had purchased an old version of Mac OS X from the App Store, open it and go to the Purchased tab. There you'll find all the installers you can download. However, it doesn't always work that way. The purchased section lists only those operating systems that you had downloaded in the past. But here is the path to check it:

1. Click the App Store icon.
2. Click Purchases in the top menu.
3. Scroll down to find the preferred OS X version.
4. Click Download.

This method allows you to download Mavericks and Yosemite by logging with your Apple ID — only if you previously downloaded them from the Mac App Store.

### Without App Store: Download Mac OS version as Apple Developer

If you are signed with an Apple Developer account, you can get access to products that are no longer listed on the App Store. If you desperately need a lower OS X version build, consider creating a new Developer account among other options. The membership cost is \$99/year and provides a bunch of perks unavailable to ordinary users.

Nevertheless, keep in mind that if you visit [developer.apple.com/downloads](http://developer.apple.com/downloads), you can only find 10.3-10.6 OS X operating systems there. Newer versions are not available because starting Mac OS X Snow Leopard 10.7, the App Store has become the only source of updating Apple OS versions.

### Purchase an older version of Mac operating system

You can purchase a boxed or email version of past Mac OS X directly from Apple. Both will cost you around \$20. For the reason of being rather antiquated, Snow Leopard and earlier Apple versions can only be installed from DVD.

- Buy a boxed edition of Snow Leopard 10.6
- Get an email copy of Lion 10.7
- Get an email copy of Mountain Lion 10.8

The email edition comes with a special download code you can use for the Mac App Store. Note, that to install the Lion or Mountain Lion, your Mac needs to be running Snow Leopard so you can install the newer OS on top of it.

### How to get macOS El Capitan download

If you are wondering if you can run El Capitan on an older Mac, rejoice as it's possible too. But before your Mac can run El Capitan it has to be updated to OS X 10.6.8. So, here are main steps you should take:

1. Install Snow Leopard from install DVD.
2. Update to 10.6.8 using Software Update.
3. Download El Capitan [here](#).

### "I can't download an old version of Mac OS X"

If you have a newer Mac, there is no physical option to install Mac OS versions older than your current Mac model. For instance, if your MacBook was released in 2014, don't expect it to run any OS released prior of that time, because older Apple OS versions simply do not include hardware drivers for your Mac.

But as it often happens, workarounds are possible. There is still a chance to download the installation file if you have an access to a Mac (or virtual machine) running that operating system. For example, to get an installer for Lion, you may ask a friend who has Lion-operated Mac or, once again, set up a virtual machine running Lion. Then you will need to prepare an external drive to download the installation file using OS X Utilities.

After you've completed the download, the installer should launch automatically, but you can click Cancel and copy the file you need. Below is the detailed instruction how to do it.

## STEP 3. Install older OS X onto an external drive

The following method allows you to download Mac OS X Lion, Mountain Lion, and Mavericks.

1. Start your Mac holding down Command + R.
2. Prepare a clean external drive (at least 10 GB of storage).
3. Within OS X Utilities, choose Reinstall OS X.
4. Select external drive as a source.
5. Enter your Apple ID.

Now the OS should start downloading automatically onto the external drive. After the download is complete, your Mac will prompt you to do a restart, but at this point, you should completely shut it down. Now that the installation file is "captured" onto your external drive, you can reinstall the OS, this time running the file on your Mac.

1. Boot your Mac from your standard drive.
2. Connect the external drive.
3. Go to external drive > OS X Install Data.

Locate **InstallESD.dmg** disk image file — this is the file you need to reinstall Lion OS X. The same steps are valid for Mountain Lion and Mavericks.
