Home Medication Management Program

Referral E-mail: info@twoniceguyspharmacy.ca

Telephone: 778-753-6897

Patients can receive assistance with their medication from a Pharmacist and Licensed Practical Nurse (LPN) from Two Nice Guys Pharmacy at no cost – in the comfort of their own home.

Who needs the Home Medication Management Program?

The program is designed to improve adherence, reduce medication errors, ease the burden for family/caregivers, improve management of chronic health conditions, and improve the quality of life for our patients. Ideal candidates for the Home Medication Management Program include patients who:

- Are unable to manage their own medications due to a change in health status or due to physical or cognitive barriers
- Have a history of medication related hospitalizations due to poor adherence
- Need medication assistance with injections or transdermal patches
- Have multiple chronic conditions, complex medication regimens, or mental health concerns including addiction
- Need home care following a hospital discharge

How it Works (Summary)

1. It starts with a phone call or visit from our Pharmacists. Upon referral, a pharmacist will:

- Comprehensively review the patient's prescription and non-prescription medications (virtually or at home)
- Provide a Best Possible Medication History and a summary to the provider including recommendations to optimize the prescription regimen, and develop a personalized care plan for medication administration and ongoing monitoring

2. Then, our Licensed Practical Nurses will provide ongoing care based on a personalized plan. Our nursing staff may:

- Administer medication daily including injections and transdermal patches
- Train patients on the use of medical devices with the purpose of supporting patient independence
- Monitoring such as blood pressure, heart rate, blood glucose, weight
- Witness ingestion daily, or review medication adherence periodically (for patients who self-administer)

3. We'll keep you informed every step of the way

- We share a summary of our records with the primary care physician, specialists, and case managers.
- Our reports include information about medication administration, monitoring results, adherence concerns, drug therapy problems, and recommendations for changes to medication regimens
