1 Assembly

Assembly Logic of Gobble Junior and Gobble Senior:
The Unit without hole in the Base (Blue) goes at the Bottom position at all times.
The Lid without the hole covers the top most unit at all times.

2 Placement

Keep Gobble away from direct rain
Safe from pets
On a flat surface, corner of terrace or balcony or garden

3 Preparation

Base Unit
Add 4 fists of Remix powder to absorb leechate
Unit A, B & C
Place small bit of newspaper to cover drain hole
Unit A
Add 4 fistfuls of Remix powder

4 For smell free composting

1 Add 3-4 fistfuls of Remix powder into the kitchen waste container
2 Mix the powder into the waste well!
3 Put kitchen waste into Unit A
4 Cover what you put in with a layer of Remix powder. Cover again with a sheet of newspaper like an inner lid to keep out fruitflies

5 Daily

Fill Unit A everyday till it is full.
Stir well once in 3 days for best results
Wipe moisture off the lid daily to avoid your pile getting too wet.

When Unit A is full, stir well add microbes, neem Mix in well.
Add more Remix powder if pile is wet.
Shift Unit A down and bring B up. Start filling waste in Unit B.

6 Keep going- shifting units

When Operating Units get full you can empty out their contents into Base Unit to mature.
Shift Empty Operating Unit to the top and start filling.
Other operating Units sit in the middle with decomposing stuff.
Base Unit always stays at the bottom

7 Harvesting

In 1.5 months from when you begin using the Gobble the contents in BASE UNIT should be almost composted.
Empty out contents of BASE UNIT in a bucket with holes.
For best results keep moist for another 1-2 months before use.

You can use compost without sieving. Unless you sieve you will not get a powder consistency of compost. Put the large pieces back into fresh waste to compost.

Placement                   Preparation
1 2 3
5 6 7
Composting naturally creates heat so water condenses inside the plastic units. Wipe this excess moisture from under the lid daily.

Stir top unit 3 times a week very well. No need to stir bottom units once kept aside.

If too much liquid builds up in your composter, it means you have put less Remix Powder. Add lots more Remix and mix in well, till all units have no excess liquid.

Get on a video call for help to fix Bad smell, Leachate, worms. Mon - Sat - 10 am - 5 pm 9916426661

Bad smell indicates your pile is soggy and needs more Remix Powder. Mix in well.

Optimum composting does not smell bad. You need to add proper qty of Remix Powder DAILY

Composting naturally creates heat so water condenses inside the plastic units. Wipe this excess moisture from under the lid daily.

Usually in a week you will begin to see small white worms. These are the larvae of the black soldier fly. There will be other bugs too.

These are good for composting and are harmless.

Control their population by adding 1 table spoon of Neem powder and mixing in well once a week. Increase the heat of the pile by adding 1 teaspoon of microbes daily. This will reduce the bugs.

Also keep aeration clear - unclog the holes in the breather caps. This will also control bugs. Use a pin.

If worms come out of the composter, sweep them into a dust pan and put back in your composter or under a tree. Birds love them.

Mature maggots become black. Soldier flies that emerge are harmless.

Don't forget to cover your compost pile with paper which helps control fruit flies. This will get wet and soggy. Tear and mix in with the pile. Use a fresh sheet.

You can also cover with a thin muslin cloth and reuse that, in place of newspaper.

If all your Gobble Units get full before 40 days, you are generating more than 1 kg of waste per day.

You will need to invest in another composter. Or try the Chomp as an additional unit.
