

Token operated control system
LAN60

Features:

This is a practical and effective control system which enables an automatic entrance to be automatically opened one time only by inserting a coded print token in the token slot provided.

This is an ideal system to control automatic barriers provided in car parks, hotels and commercial premises.

Applications:

Lan60 is a coin control system with mark code. When the coin is inserted in the special slot, the system checks the correct positioning of the marks, the size of the coin as well as its weight. If the coin is recognized, its running through a conduit causes the closure of an electric contact which activated an external circuit. The coin is then collected in a special box with a 500 maximum capacity. The coins, which are not recognized, are automatically ejected. The mechanism is also provided with a no-return device. It is suitable for the simplified control of entry or exit accesses.
