PRODUCT INFORMATION

ACRYLIC HOT WEATHER THINNER

Description

An additive to slow the drying of waterbased paint by retarding the evaporation of water from the paint film. It also enhances the flow and wet edge of the paint.

Uses

In external applications when paint is drying too quickly due to high temperatures, or there is low humidity or very windy conditions.

As a flow and wet edge extender for trim acrylics to enhance application properties to achieve a smooth and even finish.

This product can be used in all Vipond's Waterbased Paints. Suitable for interior and exterior paints.

Application

Slowly add retarder while stirring the paint. Add 5% to 10% maximum depending on conditions.

Drying

Addition of retarder slows the drying / curing of the paint film. The paint film will remain soft for longer and early water resistance may be reduced. Allow extra 2 hours before recoating and an extra 2 days for the paint to properly cure and harden.

Pack Size

250 mls, 500 mls, 1 litre and 4 litre plastic bottle

January 2021
