

# NEW INVERTER INSTRUCTIONS

Looking from above picture, there are two switches for the inverter, our engineer suggest only use the switch on the control panel as before and keep the switch closed on inverter itself.

## Whole working process

1. Insert 110v external electric supply on trailer socket, get connection for the inverter and 110v electric supply, open battery main switch, turn on the inverter, charge for storage battery.

2. Because the inverter is protected by the 80A general insurance, the main switch should be turned on before charging the battery or using 110V output etc.
