

## CloudFiler AWS Upload service

Our AWS import service is ideal for customers that have a large volume of emails to import or nested folders that need simplifying.

We first provision a dedicated, encrypted and secure storage location within our AWS infrastructure exclusively for your data, into which you can rapidly upload your emails via the **AWS Command Line Interface**; we will provide you with the required command line and connection keys.

You will provide us with a spreadsheet containing a list of location names and corresponding file paths relative to the upload root. Depending on your requirements, we can import both MSG and EML files and can collapse nested folder structures into one email folder per filing location, which is widely regarded as best practice. Once the data upload has completed, we will synchronize the emails directly into CloudFiler.

The data upload speed is typically around 1 Tb/day and the post-processing by our servers is typically a further 1.5 days/Tb.

Our team will oversee the entire process and periodically provide status updates.

We charge a day of our consulting time for the service. On the rare occasions where more work is required, we will agree the price with you in advance, once we have jointly agreed your requirements and the tasks required to meet them.
