

CONNECTING THE DOTS ON CONNECTED FIREFIGHTER

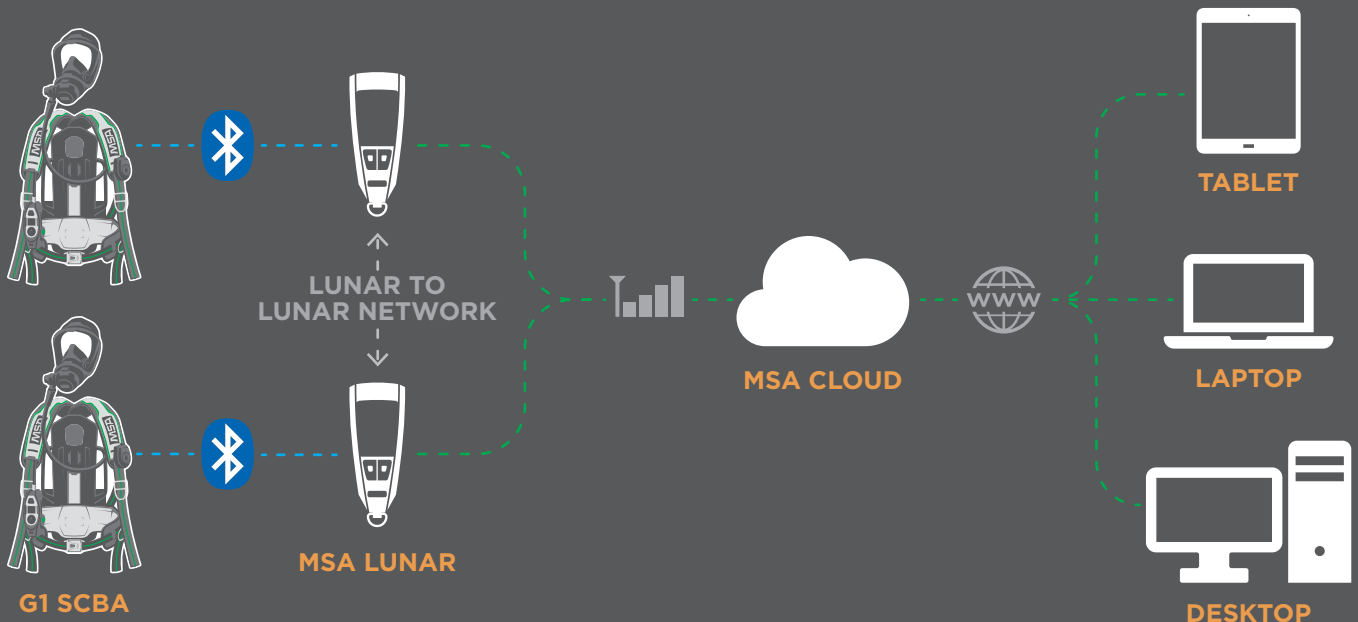

The Connected Firefighter platform offers products that will transform the way fires are fought. With these products you will have enhanced vision, unmatched situational awareness, and total accountability for everyone on scene.

With this technology, there are various forms of communication going on between the products in the platform. Let's take a look!

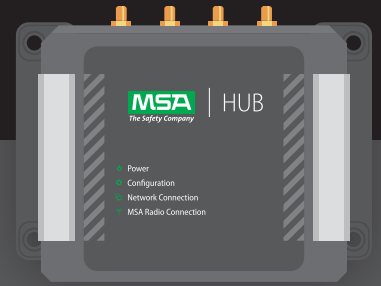

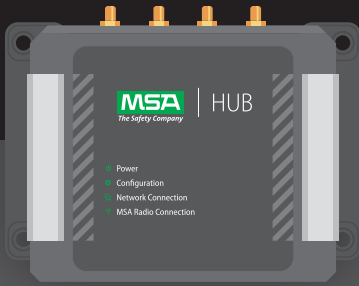

MSA LUNAR: CONNECT THE DOTS

LUNAR not only offers personal thermal imaging, search and rescue capability, and cloud connectivity, but it also seamlessly uses Bluetooth, LUNAR to LUNAR network, LTE, and internet to deliver an experience like no other.

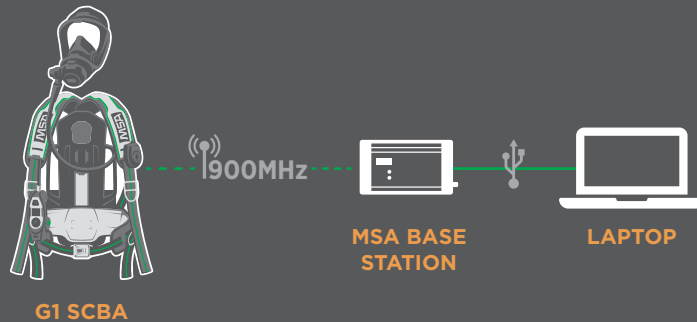

WHEN YOU GO IN, WE GO IN WITH YOU.

MSA HUB: CONNECT THE DOTS

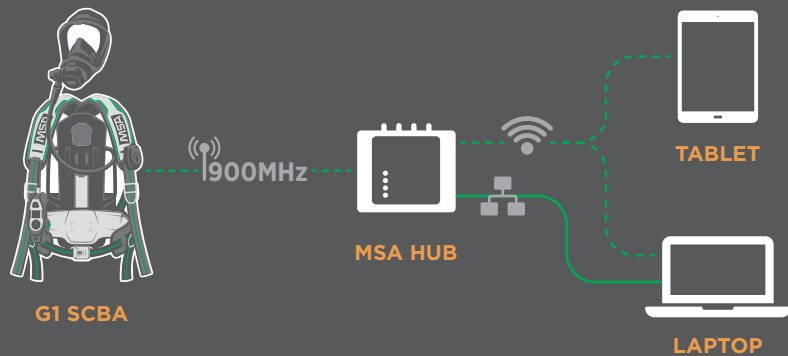

BASE STATION

The Base Station creates accountability for MSA SCBA users that have telemetry, but is limited by a wired connection from the Base Station to a laptop/Toughbook.

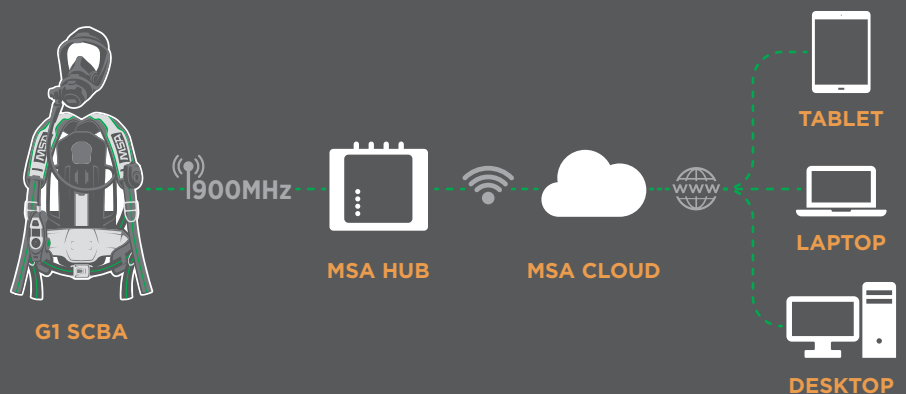

MSA HUB LOCAL INCIDENT COMMAND

The MSA HUB is the direct replacement for the Base Station offering wireless connectivity to mobile devices. Although wireless connectivity is now available, the MSA HUB can still be used locally with a hard-wired connection to a laptop or Toughbook.

MSA HUB LOCAL + REMOTE INCIDENT COMMAND

With the addition of Wi-Fi connectivity, Remote Monitoring is enabled. This functionality allows for Remote Incident Command to be “in-the-know” even off scene.
