

Using Measuring Tool to determine boot size

Instructions: Measurements are taken in a standing position with foot resting naturally on the device. Take measurements in socks normally worn.

Length: Place foot on device with heel against the heel stop. Move slide to touch the largest toe. Hold slide in place and release foot. Take note of this measurement, this is the length size. If foot is exactly on sizing line, order the next size up.

Width: With the slide on the outside of the foot place ball of foot across the device (ball joint should be centered). Press gently if foot is thin or loose jointed and heavily if foot is thick and flat. Hold slide in place and release foot. This is the width size.

Helpful observations to aid in achieving a proper fit:

- ➔ A high instep normally requires the next width wider than your measurement.
- ➔ Flat feet normally require the next width narrower than your measurement.
- ➔ Shoe sizes may vary from one brand to another. Therefore, trial-and-error fittings may be necessary for proper comfort.
- ➔ Sizing both feet is recommended.
