

TPS Component Series Coco & Peat Feed Chart and Suggestions

Coco-Coir and Peat mixes are by far the most popular mediums with our growers. They're great for producing consistent crops, and allow growers 'near-hydro' control but with a greater buffer. In general, Coco based material need additional Calcium and Magnesium as these elements tie up in the medium. TPS Component Series was built for this and if you follow the feed chart then your plants will be lush and healthy.

Instructions: With every watering, add suggested TPS Component Series dosage to your feedwater then adjust the pH.

Dry-Out recommendation: When growing in soilless media it is vital you allow your soil to dry out between waterings. Target a dry rate of 85-90% before your next watering. TPS Component Series contains surfactants and wetting agents so you may experience slightly longer dry out times than other lines. Watering at the right time will prevent root rot and allow for optimal mineral uptake.

Mid-Cycle and End-of-Cycle flush: A fresh water feeding at pH 6.0 is a good idea at the flip from veg to bloom, as well as at about week four of bloom. We also recommend pH adjusted fresh water only for the final two to three waterings before harvest.

Veg for Coco and Peat	(mL/Gallon)	Rooted Plant		Early Veg		Mid/Late Veg			
	Week	Wk 1	Wk 2	Wk 3	Wk 4	Wk 5	Wk 6	Wk 7	Wk 8
