

# AQUACOLOR

WATER BASED SYSTEM

## The Environmentally Friendly Option

Aquacolor is an environmentally friendly, water based coating system for glass, timber and other substrates. It is specifically designed to meet environmental requirements and still retain the integrity of a solvent based system.

Aquacolor is a water based polyurethane, which is internally cross-linked during production to provide resistance to chemicals, moisture and heat, maintaining colour depth, vibrancy and structural integrity.

The coating is manufactured in laboratory conditions and blended with specially formulated resins. This provides inherent adhesive qualities and when combined with its own primers and additives ensures that the coating is thoroughly bonded to the surface, enabling it to perform well over the expected life of the article.

Architects and designers now have the option to meet environmental and Government specifications and retain confidence that the coating will retain its durability and performance on a production scale.

Aquacolor is available as a White and Black base with 12 tinters to provide an unlimited range of colour options.
