Compressed Air Solutions

maXair

Product Catalogue & Technical Manual

Including extensive
Data, Information
and Instructions.
Everything you need
for a modern, efficient
Compressed Air Pipe System.

This new technical and product manual is designed to give you access to a superior system for your compressed air reticulation requirements.

Maxair utilises PE100, a product of advanced materials technology which outperforms other pipes for pressure, flow, corrosion resistance, compatibility with compressor oils & ease of installation and alteration.

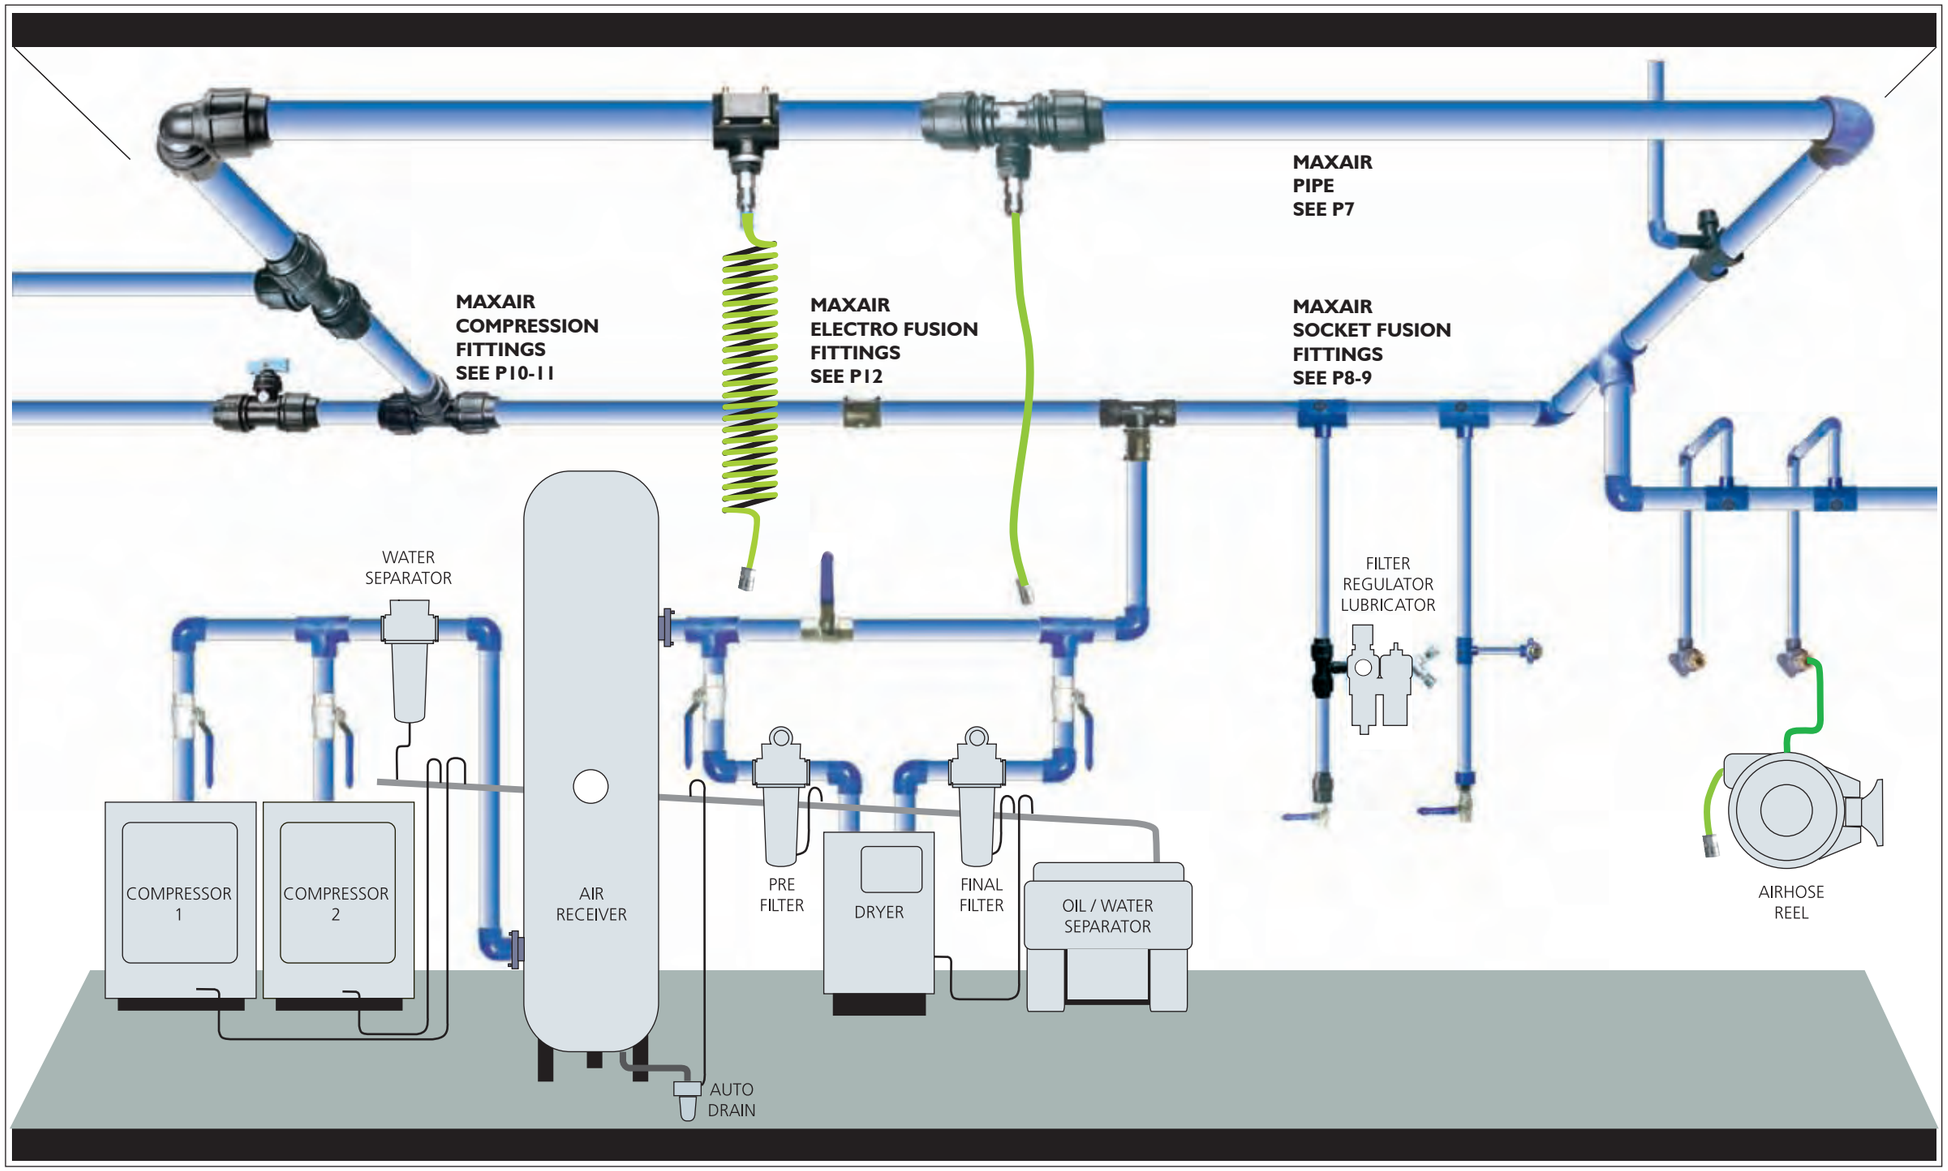
Complementing this outstanding development in clean robust pipework is a comprehensive range of quality components to help you select the best solution for your individual requirements.

This range is a result of research and experience within a broad cross section of industrial applications.

This manual includes technical data and installation guidelines to assist you to design an air supply system that is precisely tailored to your requirements.

Compressed gasses have inherent dangers, so an uncompromising standard of quality, conservative pressure ratings and the highest safety factors of any polymer piping system as set out in Australian Standards is now available.

SCHEMATIC OF A TYPICAL AIR LINE SYSTEM

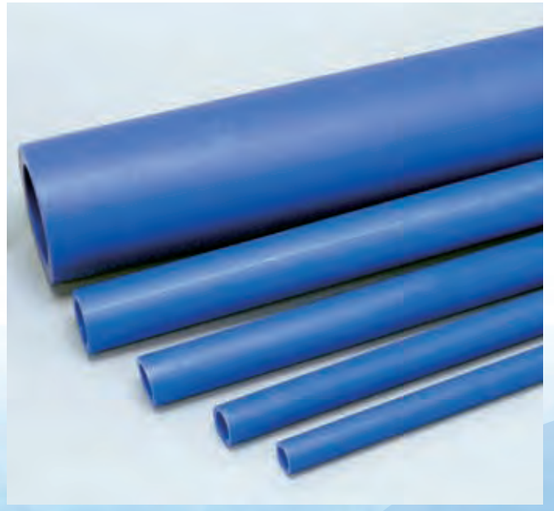


INDEX

FEATURES & BENEFITS OF MAXAIR AIR PIPE SYSTEMS

WITH MAXAIR THE CHOICE IS EASY!

- 50 YEAR WARRANTY
- SIMPLE & FAST TO INSTALL
- EASY TO ALTER OR ADAPT
- LIGHTWEIGHT
- STRONG, ROBUST, SAFE
- LOW FRICTION, SMOOTH BORE
- BROAD CHEMICAL RESISTANCE
- NO CORROSION
- NO METALLIC CONTAMINATION
- WIDE RANGE OF PIPE SIZES 20MM TO 160MM
- FOOD GRADE MATERIALS
- SUITABLE FOR BREATHING AIR
- DISTINCTIVE BLUE COLOUR
- GOOD THERMAL PROPERTIES
- SUITABLE UNDERGROUND
- UNDERPRESSURE CONNECTION FITTINGS



QUALITY 50 YEAR GUARANTEE

Meets Australian Standards AS4130 & AS4131 and made in Australia under strict ISO 9002 Certified Quality Systems. Maxair PE 100 is the highest grade of PE in Australian Standard AS4131. Blue colour to assist in identification and colour coding without painting. (Australian Standards require marking/colour coding).

GUARANTEE

Maxair PE 100 pipe is manufactured in accordance to AS 4130 / AS 4131 and is accordingly guaranteed for 50 years provided recommended design, installation and operation practices are adopted. As established from long term testing, PE 100 may be operated continuously under pressure for up to 200 years at 20degC.

ECONOMIC ADVANTAGES OF MAXAIR AIR PIPE SYSTEMS

$ Elimination of costly air leaks. This is now possible with fusion welded fittings and/or proven O-Ring fittings. Common problems with traditional materials of maintaining air pressure and recurring air leaks, prove costly in both wastage of valuable compressed air and downtime/maintenance costs to rectify leaks.

$ Energy savings through reduced friction. Ultra smooth bore and low friction material.

$$ Savings in labour costs in installation & modification.

$$ Low capital costs.

$$ Low maintenance. Along with low initial costs, the true economy of the Maxair PE100 pipe system is realised in long term efficiency, reliability, versatility and minimisation of maintenance.

COMPLIES WITH AS 4130

50 YEAR WARRANTY

ELIMINATION OF PIPE CORROSION

A major disadvantage with traditional galvanised iron air pipe has been corrosion of pipe with consequent problems: Contamination of air supply, damaging tools & pneumatics, increased friction giving energy losses, reduced bore and eventual need for replacement. Maxair eliminates this corrosion giving cleaner air and long lasting smooth bore.

DESIGN FLEXIBILITY

The three extensive ranges of Maxair fittings - Socket Fusion, Electro Fusion or Compression, all using the same pipe, offer the Designer/Engineer maximum design flexibility.
The value to Industry of a total package which is readily altered at any stage is inestimable. This system is ideally suited to today's requirement for rapid installation schedules.

QUICK, CLEAN, SIMPLE INSTALLATION

No tedious threading of pipe, flaring or gluing. Installation can be 2-5 times quicker than with traditional materials. Simple to modify. New branches, extensions or take-offs can be added with a minimum of disruption & cost. The typical inflexibility of traditional systems is overcome. An extensive range of fittings provides further design versatility.

CHEMICAL RESISTANCE

Maxair has broad chemical compatibility and provides a solution for harsh corrosive environments. Fusion welded fittings provide a high degree of safety in these areas. Welded PE 100 is the ultimate Polyethylene system due to its fused jointing, minimum entrapment and high safety factor. Please refer to Technical Department for specific applications.

FOOD CONTACT GRADE MATERIALS

Maxair PE100 pipe and fittings conform with AS2070.1 "Plastic material for food contact use", providing system approval for use within a food plant.
Maxair PE100 does not support micro-organisms or bacterial growth.
Maxair Compression fittings conform to AS4129, BS6920.
Maxair Heavy Duty B.S.P threaded fittings conform with AS3855.3.

SUPERIOR STRENGTH

Maxair has higher strength, greater wall thickness and a higher safety factor of 2:1 than other grades of PE currently on the market. Maxair has excellent pressure/temperature capabilities with minimum 50 year design life. Manufactured to PN25 providing a compressed air rating in accordance with Australian Standard AS4130 of 16 bar or 235 P.S.I. @ 20deg C with a 2:1 safety factor. Extremely robust. Impact resistant - is ductile in nature so will not shatter like PVC (PVC is not safe for compressed air). Excellent for underground applications. Thermally stable and suitable for -20deg C to +60deg C continuous, with peaks of up to 95deg C.

CHOOSING YOUR MAXAIR SYSTEM

STEP ONE: SELECT PIPE SIZE.

Four factors need to be taken into consideration when selecting pipe sizes for compressed air reticulation.

-Flow required -Pressure -Distance -Future Expansion

A pipe size should be selected using the chart that allows for maximum compressor output Free Air Delivery (F.A.D.) at the required operating pressure and allow an additional margin for long distance and future expansion.

In practice we recommend a minimum reserve margin of 30%. Larger pipe provides reserve capacity for peak demands.

PRESSURE/FLOW TABLE

Maximum recommended air flow for each pipe size.

PRESSURE		AIR 20		AIR 25		AIR 32		AIR 40		AIR 50		AIR 63		AIR 90		AIR 110		AIR 160		PRESSURE	
BAR	PSI	l/sec	cfm	l/sec	cfm	l/sec	cfm	l/sec	cfm	l/sec	cfm	l/sec	cfm	l/sec	cfm	l/sec	cfm	l/sec	cfm	BAR	PSI

10	145	29	61	57	122	112	237	191	405	351	744	697	1476	1896	4019	3117	6606	8766	18576	10	145
13	189	39	83	78	164	151	321	258	547	475	1006	942	1996	2564	5434	4215	8933	11853	25118	13	189

The flow values allow for a pressure drop of 4% of applied pressure over 30 metres of pipe. If a maximum pressure drop of 2% is desired, figures listed above should be de-rated by approximately 20%-30%.

The above table is calculated using values derived from Mueller's formula for gaseous flows.

CONVERSION FACTORS

PRESSURE
1 psi = 0.069bar
1 kpa = 0.145psi
1 bar = 100kpa
1 bar = 14.5psi
1 kg/cm^2 = 1 bar

FLOW
1 cfm = 0.4719 L/sec
1 l/sec = 2.119 cfm
1 m^3/min = 35.3147 cfm
1 m^3/min = 16.67 L/sec

Approximate compressor output calculation:
1kw x 1.35 = HP x 4 =CFM for Screw compressors.
For Piston compressors some manufacturers quote displacement which needs to be derated by 0.75 to calculate F.A.D. (Free Air Delivery).
Size of receivers shall be calculated as 10 times the flow in l/s optimum or 6 times the flow in l/s minimum.

STEP TWO: SELECT FITTINGS.

Select the fitting style most suitable to your requirements. Three ranges are presented. Note that a combination is often used.

Socket Fusion Weld Fittings
(See P8-9) are joined quickly and easily using a welding tool (see P25) and results in a fully fused joint of highest integrity which is leak free, tamper proof and visually pleasing.

Compression "0" Ring Fittings
(See P10-11) are joined quickly and easily by hand (see P24) and offer the advantage of being removable and reusable.

Electro Fusion Weld Fittings

(See P12) are assembled by hand and an electric current is applied via an Electro Fusion Welder (see P25). These fittings enable one or more joints to be assembled and aligned or adjusted prior to welding. This makes the installation of large bore pipework extremely quick and simple plus giving the advantage of a fully welded system.
Also included in this range are **"Under-pressure air saddles"** which are designed for under pressure connections thus eliminating the need to shut down plant and equipment for new connections. They are particularly useful in large plants with 24 hour operations.

STEP THREE: SELECT OUTLET REQUIREMENTS

Select outlet filtration, regulation, lubrication requirements (see P21), and quick couplings, hoses, etc. (P19 & 20) to suit your requirements.

MAXAIR PE100 COMPRESSED AIR PIPE

MANUFACTURED TO AS/NZS4130 STANDARD.

AIR TREATMENT

Compressed Air contains impurities such as dust and dirt (approximately 80% of these pass through the compressor inlet filter), and water vapour is also present as humidity, concentrated eight times as compared to the air we breath.

These impurities combine with traces of compressor oil to form an abrasive sludge which wears and corrodes bearings and seals in pneumatic tools and equipment. For this reason it is imperative to include **Air Treatment** in your system which will protect your equipment. We can assess and advise you as to your particular requirements, please refer to technical department.

PRE-FILTERS, FINAL-FILTERS AND ACTIVATED CARBON FILTERS (BREATHING AIR)
We offer a large range of multi-layer coalescing filters to remove particles, oil & water mists.

REFRIGERANT DRYERS
Dryers cool compressed air to approx 3˚ dew point and remove condensate before entering pipe system. They must be sized correctly and be rated for Australian conditions.

DESSICANT DRYERS
Twin tower Dessicant Dryers remove condensate and give very low dew-points (water vapour). They are mostly used in specialist or medical applications.
Single tower Dessicant Dryers are suitable for general applications. Please refer to Technical Department.

OIL / WATER SEPARATORS
Treatment of condensate to meet legal discharge requirements.

FILTER REGULATOR

REGULATOR FILTER REGULATOR LURICATOR
Full range of Regulators, Filter Regulators and FRL's available. Auto drain models also available.

AUTOMATIC DRAINS
Full range of Automatic Condensate Drains available including bottom entry type.

NIL AIR LOSS AUTOMATIC DRAINS
Electronic sensor drains. 240V.

BLOWGUNS

BLOW GUNS
Standard Blow Guns, Long Nozzle, Safety Tip, Rubber Tip, Flat Nozzle, Blow / Vacuum Venturi Effect, Reduced Pressure Safety Styles.

A full range of Push-in Fittings.

A wide range of Push-in Fittings are available to suit flexible tubing in 4mm, 6mm, 8mm, 10mm, 12mm, & 16mm.
Thread sizes: 1/8", 1/4", 3/8", & 1/2" BSP.
Some common fittings are pictured, the range also includes multiple manifold outlets, isolating valve fittings, speed controllers, rotating fittings, check valves and more.
Phone for your specific requirements.

MAXAIR SYSTEM DESIGN GUIDELINES

RECOMMENDED INSTALLATION PRINCIPLES

THERMAL EXPANSION AND CONTRACTION PIPE CLIPS / PIPING LAYOUT

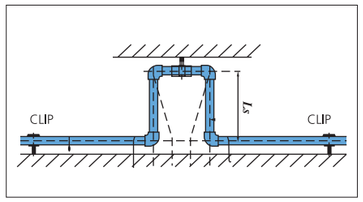
The coefficient of the thermal expansion and contraction of Maxair PE100 pipe may be taken as 0.18mm per metre per Deg C. If pipework is to be subjected to thermal temperature change, expansion and contraction needs to be considered for during installation. Generally movement can be absorbed on changes of direction, elbows, etc. but on longer lengths the recommended installation principles as set out below should be adhered to. This movement is minimised if areas in which pipework is installed are heated or cooled and virtually eliminated in constant temperature areas.

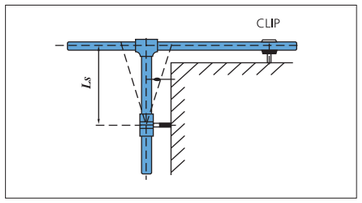
EXPANSION LOOPS

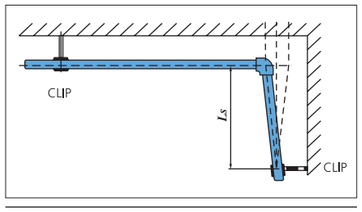
Expansion loops are recommended at intervals of approx. 30-40m on long runs. Suggested leg lengths are as per table below. It is general practice for loops up to AIR 63 to span between purlins. Space constraints may also need to be considered. Please contact our technical department for accurate sizing if required.

PRE STRESSING

Pipework can be prestressed, and particular note should be made of this when installation is carried out in cold conditions.

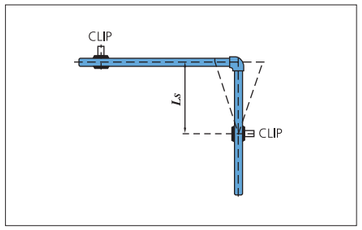






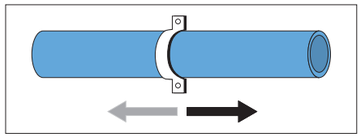
Suggested L s Length (Metres)

20	0.5
25	0.6
32	0.7
40	0.9
50	1.0
63	1.2
90	1.8
110	2.0
160	2.4



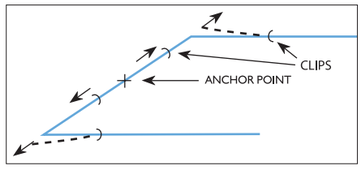
PIPE CLIPS

Free axial movement of pipework should be allowed with any form of support.
Pipework should be able to move on elbows, tees, etc.

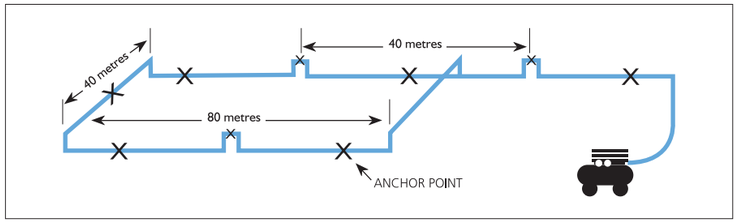


ANCHOR POINTS

Anchor points are clips which don't allow free axial movement. Anchor points can be used as shown to evenly spread the effects of expansion and contraction.



Below: Working example of Ring Main showing typical expansion loops and anchor point positions for this schematic.



OPERATING PARAMETERS OF MAXAIR PE100	OPERATING TEMP °C	DESIGN LIFE YEARS	PERMISSIBLE WORKING PRESSURE		
			BAR	KPA	PSI
	- 20° TO 20°	50	16	1600	235
	30°	50	14.1	1410	205
	40°	50	12	1200	175
	50°	50	10.2	1020	150
	60°	50	8.8	880	130
		ABOVE RATINGS HAVE AN ADDITIONAL SAFETY FACTOR OF 2:1			
	Fluid at 20° C	50	25	2500	360

SHORT TERM TEMPERATURE RISES

Temperatures quoted relate to constant temperature over a period of 50 years, rather than short term peak temperatures. Maxair PE100 can safely handle short term peaks in compressed air temperature up to 95deg C. Circumstances vary and each high temperature application should be checked with your distributor.

SAFETY FACTOR

At all rated pressures for compressed air as above Maxair PE100 is manufactured with a safety factor of 2. On a typical installation this gives an effective safety factor of 4 at 800 kpa/20deg C /50 years.

GUARANTEE

Maxair is manufactured in accordance to AS 4130/AS 4131 and is accordingly guaranteed for 50 years provided recommended design, installation and operating practices are adopted. As established from long term testing, Maxair may be operated continuously under pressure for up to 200 years at 20deg C.

CONDENSATE DRAINAGE

Ideally, condensate should be removed as soon as possible in the system.
A suitably sized compressed air dryer after the Air Receiver is the recommended method for removing condensate from the air supply. If high, short term peaks of dry air are required, then the dryer would be better installed prior to the Receiver. The good thermal characteristics of Maxair are a further advantage.
The system should be designed to minimise or eliminate harmful condensate from being discharged into air tools and equipment when dryers are not fitted.
Various methods are suitable for this purpose.
- Sloping of horizontal pipe at a slight gradient to strategically positioned drainlegs.
- Outlet droppers to come off the top of the pipework to avoid precipitated condensate being discharged in the airstream.
- In most instances however the recommended method is to install the dropper from the bottom of the branch or mainline with a short extra length of pipe extending below the outlet with a drain valve (see schematic illustration P2).

UNDERGROUND PIPEWORK

Maxair pipe is ideal for underground installation with its high strength characteristics and ability to absorb ground movement. It is recommended to lay pipework in sand, grade and install drain valves in strategic positions.

HAZARDOUS AREAS

A. Corrosive chemicals – Maxair has excellent resistance to a broad range of chemicals and is ideal for use in many areas where corrosive liquids or atmosphere may contact the pipe. Compression fittings come standard in polypropylene construction with O-Rings of nitrile rubber and Split Grip Rings in Polyacetal. The Nitrile gives excellent resistance to oils in the compressed air. For aggressive chemical applications CPVC Split Rings and O-Rings in EPDM or Viton are available. Fusion welded fittings provide a further degree of safety in these areas. User should verify compatibility of components with their application. Extensive compatibility charts are available. Resistance to specific chemicals should be checked with Technical Department.

B. Explosive or ignitable atmosphere. Compressed air can carry static charges which may accumulate. The user/customer/purchaser is responsible to identify any potential hazardous areas and to take necessary measures or precautions for complete safety. Information on protective measures is available with advice on your specific application.

HEAT SOURCES AND EXTERIOR PIPEWORK

Maxair is suitable for outdoor installation
Industry best practice of shielding equipment and pipework from direct heat sources should be adopted to prevent excessive heat buildup. In the event that pipe is exposed to direct sunlight a surface layer forms over time creating a barrier which impedes further U.V. effects. As with all Polymer pipe systems exposed to direct U.V., there maybe some reduction of impact resistance over time however longevity and pressure rating of Maxair is not affected.

SOCKET FUSION WELDED FITTINGS

Pipe and fittings are welded by means of socket fusion according to AS2033-1980. Fittings comply with DIN16963. These specially engineered fittings, in dimensions and tolerances to co-ordinate with pipe, are heated simultaneously with pipe then joined to give an extremely strong weld of high pressure capability, fusing pipe and fitting into one integral piece. Made in Europe from PE100 expressly for compressed air pipe systems.

ELECTRO FUSION WELDED FITTINGS

Fittings for electro fusion comply with AS4129 and carry a standards mark licence under a Quality Assurance System in accordance with ISO 9002. The fittings incorporate a resistor in one of the terminals which is specific to that fitting. The automatic control box reads the resistor and sets and welds the correct time, avoiding operator error. Fittings are also labelled for barcode reading and manual setting times. Rising melt indicators confirm successful completion of weld.

COMPRESSION O-RING TYPE FITTINGS

Compression fittings manufactured under ISO 9002 Quality System and have Standards Mark Licence No 2018-AS4129.

Air seal is provided by a heavy duty O-Ring and pipe is securely held by split grip ring and nut. Extensive research and experience has confirmed our confidence in the range of fittings offered being of the highest quality and reliability. These fittings are approved by the manufacturer for compressed air applications and, whilst they are conservatively rated at PN16 (16 bar)/20degC/50 years for other applications, with a view to an additional safety factor for compressed air, we recommend these fittings for installations subject to conditions not exceeding 10 bar pressure at constant average temperature of 40degC.

The majority of installations would be expected to average less than these conditions. For conditions above these, fusion welded fittings should be considered.

PIPE WEIGHTS COMPARISON

MAXAIR		GALVANISED MILD STEEL		COPPER	
SIZE	WEIGHT Kg/m	SIZE	WEIGHT Kg/m	SIZE	WEIGHT Kg/m
AIR 20	0.15	1/2"	1.45	1/2"	0.35

AIR 160	9.17	6"	23.33	6"	8.67

MAXAIR INSTALLATION INSTRUCTIONS

PROCEDURE: 1. INSTALL CLIPS & PIPE SUPPORT SYSTEM. 2. FOR SOCKET FUSION PRE-MANUFACTURE MAIN LINES ON GROUND.

Compression Fittings AIR20 to AIR63

1. Cut pipe to length with appropriate cutter (PC...) for a swarf-free finish.

2. Chamfer with appropriate chamfering tool. (CHAM...) This may not be necessary for AIR20, 25, 32.

3. Remove nut and conical grip ring from fitting and mount on pipe in the same order with the large end of the grip ring facing fitting. Lubricate, see notes*, **.

4. Insert the pipe into fitting with a twisting motion until it passes through the "0" ring and meets the internal shoulder. Ensure that grip ring is touching the fitting.

5. Screw and tighten the nut onto the fitting firmly by hand. The larger pipe sizes 40mm & upward will need tightening with the appropriate wrench (NW1) however, do not use excessive torque.

Compression Fittings AIR90 to AIR110

1. Cut pipe to length and chamfer.
2, Remove nut, conical grip ring, bushing and "0" ring and mount on pipe in the same order leaving out grip ring.
3. Lubricate pipe end and inside of fitting.(See note below**)

4. Insert pipe into the fitting until it meets the internal shoulder.

5. Bring up the "0" ring and bushing and tighten nut until they are fully in place.

6. Unscrew nut, open grip ring and put on pipe with the large end touching the bushing.

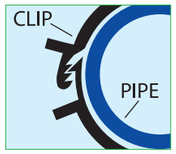
7. Tighten nut with the appropriate wrench (NW2) taking care not to use excessive force.

*Fitting may be supplied with a tapered seal instead of O-Ring, -in this case nut need not be removed, - simply chamfer pipe, lubricate, fully insert, and tighten.

** Lubricate with silicone spray, soapy water or vaseline except on specialist applications. ie: powder coating, spray painting, breathing & quality air, etc. DO NOT use penetrating fluids such as WD40, 5-56, Penetrene etc.

CL Pipe Clips Installation

1. Mount pipe clip using appropriate fastener. In vertical mounting situations (horizontal pipework) ensure female ratchet is uppermost as shown below.



2. Pull clip apart and put the pipe in.

3. Press the pipe into clip towards the clip base and set to appropriate setting.

To remove pipe from clip push the 2 bands sideways in opposite directions to disengage.

Pipe Support spacings

	HORIZONTAL SUPPORT SPACING	
PIPE SIZE	UP TO 25°C	UP TO 50° C
AIR20	**700**	600
AIR25	**900**	750
AIR32	**1200**	900
AIR40	**1400**	1100
AIR50	**1600**	1200
AIR63	**1800**	1400
AIR90	**2000**	1600
AIR110	**2400**	1800
AIR160	**2700**	2100

Spacings may need to be altered for various ambient temperatures encountered. Refer to Technical Department. For vertical fixing, the spacings may be increased approximately 20%. Spacings may also be increased using Continuous support Channel, see P17. Spacings will need to be decreased if pipework is conveying fluids.

MAXAIR WELDING GUIDELINES

3. INSTALL PIPE WORK INTO CLIPS. 4. INSTALL BRANCHES & OUTLETS. 5. TEST AND COMMISSION PIPE SYSTEM.

Electro Fusion Welding – Recommended for AIR90 to AIR160

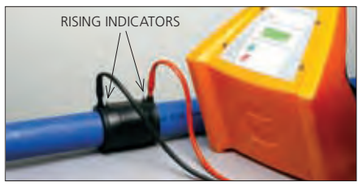
Available in smaller sizes if required

1. Cut pipe to length using appropriate cutters.
2. Use scraper WPS 16063 to remove oxide layer from pipe for full fitting insertion length to approximate depth of 0.3mm.

3. Wipe surfaces to be welded with Welding Wipes (EFPW) to remove dust etc, and allow cleaner to evaporate.

4. Assemble pipe and fitting making sure pipe is FULLY inserted. Clamps may be attached to stabilise joint during welding.

5. Connect welder leads onto fitting terminals. Set correct weld time (marked on each fitting). Follow instructions for particular welder. Press start for weld cycle to commence. Allow to cool, time is marked on each fitting.



6. Rising melt indicators confirm successful completion of weld. When Weld cycle is completed, allow assembly to cool without any movement or strain.

WELDING GUIDELINES.

Socket Fusion and Electro Fusion welding is a quick and simple operation for a joint of the highest integrity.

SOCKET FUSION

Heating element socket fusion to welding guideline AS 2033-1980. Weld surfaces must be clean and dry. Welding machine must be up to temperature 230° - 250° C before commencing. Avoid cold windy conditions. Do not realign joint after adjusting time, see table below. Do not overscrape pipe - interference fit must be retained. Do not twist pipe into fitting when fusing.

Socket Fusion Welding Time/Temperature Chart

Pipe OD mm	Pre-. Heating Sec.	Adjusting Sec.	Cooling Min
20	5	4	2
25	7	4	2
32	8	6	4
40	12	6	4
50	18	6	4
63	24	8	6
90	40	8	6
110	50	10	8

ELECTRO FUSION

Fittings for electro fusion comply with AS4129.
Automatic control box reads resistor and sets and welds the correct time, fittings also labelled for manual setting times. Weld surfaces must be clean and dry.
Do not overscrape pipe.
Use correct scrapers.
Do not use emery paper or metal files.
IMPORTANT: Do not allow movement in the joint until cooling period has been completed. In some cases clamps may be required. Ensure continuous electricity supply during weld cycle.

Socket fusion Welding Instructions AIR20 to AIR63

Socket Fusion Bench Machine as pictured on p13 for up to AIR90.

1. Turn on Welder SFHM. Do not attempt welding unless tool is up to temperature (250°C). The light will flash on/off with thermostat control when temp. is correct.
2. Cut pipe to length required with (PC...) cutters for a swarf free finish.

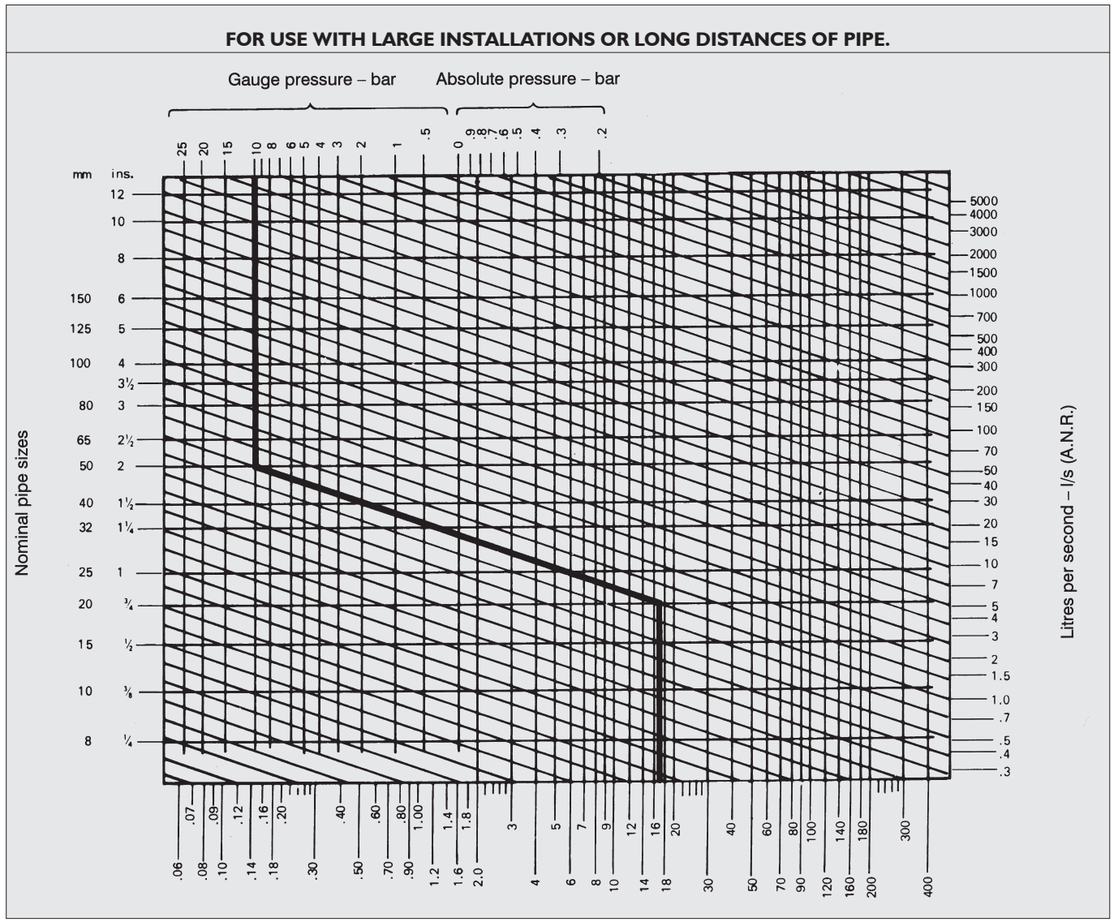
3. Clean pipe & fitting. Use scraper (WPS...) to remove oxide layer from pipe and ensure correct tolerance. Welding wipes (EFPW) may be used if required.

4. Simultaneously insert pipe and fitting onto socket and spigot to full depth without twisting. Hold for correct time as per table 'Pre-heating seconds' (left) .

5. Remove pipe & fitting from heating element, immediately insert pipe into fitting without twisting.

6. Check alignment within 'adjusting seconds' as per table (left).
During cooling avoid mechanical strain or movement on welded joint.

COMPRESSED AIR FLOW CHART



Note: A.N.R. (Atmosphere Normale de Reference) Standard Reference Atmosphere ISO R554 - 20degC 65% Relative Humidity 1013 mbar

Conversion: 1mbar=0.1 kpa
1l/s=2.1191cfm

How to use the compressed air flow chart.

Four quantities are involved in the use of this chart, these being air pressure, rate of flow, pipe size and pressure drop. Any one of these can be determined providing the remaining three are known.

PROBLEM 1:
Air initially at 10 bar is being transmitted at a rate of 60 l/s free air through 20mm pipe. What will be the pressure drop due to friction through 30 metres of pipe?

SOLUTION:
(This example is plotted on the chart) From the point representing 10 bar at the top of the chart proceed down vertically to intersect with the horizontal line representing 60 l/s on the right hand scale. Proceed diagonally downwards, parallel to the guide lines to intersect the horizontal line representing 20mm on the left hand side scale. From this point proceed vertically to the pressure drop scale on the bottom of the chart and take the reading. The pressure drop is found to be approximately 17 mbar per metre of pipe or 510 mbar (0.5 bar) per 30 metres of pipe.

PROBLEM 2:
10 l/s of free air is required at a pressure of 4 bar with a maximum allowable pressure drop of 140 mbar per 30 metres of pipe. What would be the recommended pipe size for this application?

SOLUTION:
From the point representing 4 bar on the top axis of the chart proceed down vertically to intersect the horizontal line representing 10 l/s on the right hand scale. Proceed diagonally, parallel to the guide lines to intersect the vertical line from the bottom scale representing the allowable pressure drop of 140 mbar per 30 metres of pipe (Read 140/30 = 4.5). From this intersection point proceed horizontally to the left hand side of the chart. The point falls between 10mm and 15mm pipe sizes. The correct selection therefore, is 15mm pipe.

BREATHING AIR

Breathing and Medical applications
Maxair is suitable for breathing air and medical applications, provided Technical Department recommendations are adopted. It is the user's responsibility to provide and maintain supply air at a suitable level of purity for these applications.

STORAGE

Storage and transport
Pipe should be stored and transported straight and true.

Shipping Weights.

AIR20	0.9 Kg / 6m length
AIR25	1.4 Kg / 6m length
AIR32	2.4 Kg / 6m length
AIR40	3.5 Kg / 6m length
AIR50	5.5 Kg / 6m length
AIR63	8.7 Kg / 6m length
AIR90	18 Kg / 6m length
AIR110	27 Kg / 6m length
AIR160	55 kg / 6m length

OTHER USES

Suitability for other applications.
Products in this technical manual are also suitable for:

- Chilled Water
- Warm Water
- High pressure Fluid to 25 bar
- Inert Gasses
- Chemical Piping
- Vacuum Piping.

TECHNICAL SPECIFICATIONS FOR MAXAIR PE100 SYSTEMS

1.1 The Compressed Air Reticulation Pipe shall be of non-metallic, blue in colour, corrosion free, High Density Polyethylene (HDPE) PE100 conforming to AS/NZS 4130/4131 and be made to PN 25 under an accredited AS 3902 Quality Control System and commercially known as MAXAIR PE100.

1.2 The pipe shall be PN 25 rated at 16 Bar / 20degC / 50 year design life and 8.8 Bar / 60degC / 50 year with an applied safety factor of 2:1.

2.1 All fittings shall be Socket Fusion, Electro Fusion or Compression style fittings which comply with Australian Standards as listed below and commercially known as MAXAIR.

2.2 Socket Fusion fittings shall be Blue PE100 type made to DIN 16963 which shall be welded to AS 2033.

2.3 Electro Fusion fittings shall comply with AS/NZS 4129 and carry a Standards Mark Licence under Quality Assurance System in accordance with ISO 9002.

2.4 Compression fittings shall be either 'O' Ring or tapered seal to comply with AS/NZS 4129 and carry a Standards Mark Licence No. 2018 in accordance with ISO 9002.

3.1 Fixing of pipe shall be of a type and spacing approved for use on HDPE PE100 as per MAXAIR Technical Manual.

TRADING TERMS

Whilst due care and revision has been taken in preparation of this Manual, the Company takes no liability for accuracy of information contained herein.

As part of a process of continual improvement, the Company reserves the right to upgrade or modify components from the description in this manual at any time without notice.

All Sales are subject to the Company's Terms and Conditions of Sale.
