## **Pneumatic** **Bore size** $\phi 40 \sim \phi 250$ **Rotary actuator**

**TA**  
SERIES **2**

Valve mounting interface : IS05211 compliant.

Solenoid valve mounting interface

: NAMUR compliant.

**TA**  
**TW**

For operation of large-diameter valve

Valve mounting interface : ISO5211 compliant.

Solenoid valve mounting interface : NAMUR compliant.

For operation of large-diameter valve (TA-200-TW-250)

Reliable actuator technologies backed with experiences for a long time enables firm and safe automatic operations of any large-diameter valves.

## Option Information

We provide extensive options that flexibly meet various devices and environment surrounding the rotary actuator for total system design. These options work effectively not only as single components but also in combinations.

## Features

### 1 Extensive options

Many models with various options are now available as standard. They meet versatile requirements for total system establishment.

### 3 Light weight and compact design

Employment of die-cast aluminum into main components and unique body shapes achieves the lightweight and compact design.

### 2 Complying with NAMUR standards

Solenoid valve mounting interface and optional actuator top mounting interface comply with NAMUR standards (VDI/VDE3845).

NAMUR-compliant solenoid valve mounting interface

### 4 Oilless operation

High-quality lubrication-free materials are used as piston sliding packing and sliding materials for bearing to maintain the high reliability in the non-lubrication operation.

### Spring cartridge

This system makes it possible to change the operation from single-acting type to double-acting type and vice versa. The single-acting type is structured to obtain the same output torque as that of the double-acting type in the air operation mode. (Patented)

## Features

### Scotch yoke driving system

The scotch yoke mechanism which is compact yet allows high-efficient driving is employed. Both TA-200 and TW-250 exhibit the optimal torque characteristics for valve control requiring the maximum torque at the rotation beginning and final ends.

### Abundant optional devices

Abundant optional devices have been standardized. The total system helps valve automatic operations.

### Connection method

The yoke or coupling-free direct mount system is employed for connection to valves.

- TA-200 employs a female angle conforming to ISO standards.
- TW-250 employs a female key socket system conforming to ISO standards.

### Electro-pneumatic Positioner

The electro-pneumatic positioner controls rotational angle of an actuator (valve) accurately without restriction.

### Spring cartridge

A spring built-in cartridge for single-acting type (spring return) focusing on safety.

### Switch box

The high-accuracy limit switch box is provided for detecting rotational position of an actuator (valve). (Protection class: IP65)

### NAMUR-compliant Compact Size Explosion-proof Solenoid Valve

Explosion-proof (d2G4) 5-port solenoid valve for driving actuator can be used safely in the environment with explosive gas atmosphere.

※ Intrinsic-safety (i2G4) and hydrogen explosion-proof (d3aG4) type 5-port solenoid valves can be mounted as options. For details please consult separately.

### Manual handle

A manual operation unit to be used for single-acting type.

### NAMUR-compliant 5-port Solenoid Valve (Incorporating bypass valve)

The 5-port solenoid valve for driving actuator incorporates a bypass valve to adjust the exhausting amount and is equipped with a speed controller as standard.

### FR Unit (Regulator with Filter)

FR unit controls the quality of air sent to an actuator. The unit is composed of a regulator for pressure adjustment and a filter for removing foreign substances in fluid.

### Sub base

A base for piping in case of single-acting type. (spring return) (Equipped as standard in case of single-acting type)

### Bypass Valve Incorporating Speed Controller

The bypass valve made of resin incorporates a speed controller that flexibly adjusts the actuator rotational speed (valve open/close speed).

# Pneumatic Rotary Actuators and Systems

## General Handling Instructions and Precautions

Please read the following general handling instructions and precautions carefully before ordering rotary actuators.

### Safety Precautions

#### References:

JIS B9702:  
Safety of machinery principles of risk assessment  
JIS B6370:  
Pneumatic fluid power general rules relating to systems

 **Warning** Following information is based on a risk assessment for Konan pneumatic rotary actuators (hereafter referred to as actuator). Each section provides information essential for safe operation of the actuators and prevention of risk and damage that may affect operators. Please read carefully.

#### ① Selection of actuator

##### 1.1 Shock and mechanical safety

Rotary actuator is an actuator to rotate loads by means of pneumatic pressure. It is often used for high-speed operation systems and equipment with heavy loads. In order to enable safe operation of a system incorporating the actuator, it is essential to select appropriate type and size of actuator for the load and motion energy as well as take into consideration the load connection method.

In particular, if motion energy of the load is high (large mass and high-speed operation), appropriate type and size of actuator must be selected.

For example, rotating loads with large inertial force such as dampers may cause damage to internal components of the actuator and connection components that may affect operators and surrounding mechanical systems.

##### 1.2 Output torque characteristics of actuator

Output torque of an actuator is provided by multiplying the internal piston output (supply pressure & piston area) and length of piping. The characteristics of output torque differ depending on the mechanism that converts the linear action of internal piston into rotating action.

In concrete, in the pneumatic double-acting type and rack-and-pinion mechanism type actuators the output torque increases constantly within the whole rotation range, while in the scotch-yoke type the torque is minimum at the center of rotation angle and increases as the rotation angle comes closer to both ends.

Selection of an actuator should be made with a torque suitable for operating the load.

##### 1.3 Load factor and redundant safety

Output torque of an actuator is provided by multiplying the internal piston output (supply pressure & piston area) and length of piping. In order to get sufficient speed (dynamic output), select the actuator size so that the load factor to the output torque indicated in the catalogue becomes no more than 70%.

In case the actuator plays a significant part of the system functionality or that it is used with conditions in which routine maintenance is difficult, the system should be designed to lower the actuator load factor.

For example, selecting a larger size actuator will reinforce impact resistance.

##### 1.4 Mechanical back-up

For securing safe operation of an actuator even in case of entire error of functions involving pneumatic pressure, select a spring offset actuator (hereafter single-acting type actuator) or take other measures to maintain the operation by means of different energy sources.

##### 1.5 Entire safety consideration

Select the actuator model and size in a comprehensive planning and design process of a pneumatic control system, taking into consideration the direct performance requirement as well as the safety in various conditions, including installation, adjustment, full-scale operation, failure, and disposal.

#### ② Design of load interface to actuator

##### 2.1 Connection with loads

Install the actuator so that thrust load and transverse load are not applied to the spindle.

Apply an independent stopper to the rotational axis on the load side in order to prevent axial movement. (Do not use the spindle of the actuator as a stopper.)

Ensure that the load has sufficient insertion length into the spindle, or the mating surface pressure increases to enlarge clearance, which may cause failure in the load positioning.

#### ③ Actuator installation

Actuators have precise operational functions and are used for applications with versatile conditions and environment. It is therefore sometimes difficult to assume all concerned risks or risk factors when designing an actuator. In such cases the actuator function and performance may be deteriorated in a period shorter than the maintenance period set by the manufacturer.

In order to avoid the risks, install the actuator as instructed below.

##### 3.1 Maximum rotation speed

Do not use the actuator with the speed over the maximum rotation speed indicated in the catalogue. Depending on the shape of loads the actuator may be collapsed by inertial force.

##### 3.2 Installation site

Install an actuator in a place where setting and maintenance is easy.

##### 3.3 Operating procedure

Conduct actuator operations test for any abnormality before connection with loads. Then connect loads and check for thrust load and transverse load to the spindle, air leakage from the connection ports, and other abnormalities before installation into the system. If no abnormalities are found, then check the entire system operation.

##### 3.4 Prevention of abrupt rotation of actuator

If an actuator is not in the position under control of a directional control valve at air supply after installation or during maintenance, it may rapidly shift to the control position. In order to avoid this risk, install a slow-start valve at the IN port of the directional control valve.

##### 3.5 Indication

If an actuator nameplate cannot be seen due to installation environment, place an alternative indication near the actuator.

##### 3.6 Residual pressure

An actuator should be installed taking into consideration the risks for sudden blowout of compressed air and unintended operation due to air pressure remaining in the actuator even after exhaustion of air.

##### 3.7 Training

A sufficiently trained person should be responsible for installation and maintenance of an actuator. (Konan provides training for operation and maintenance of pneumatic components. Feel free to contact our sales personnel for details.)

#### ④ Maintenance of actuator

Maintenance should be performed in accordance with the following steps. Feel free to contact our sales personnel for separate maintenance manual.

##### 4.1 Daily inspection

- 1) Exhaust drain from the air filter.
- 2) During operation of the system, observe the actuator visually and acoustically from a safe place for loosening of screws and other external abnormalities as well as abnormal noise.

Inspection should also be performed while the system is not in operation without exhausting pressure for: loosening of screws; external air leakage; and air leakage from exhaust port of the directional control valve and piping joint.

## 4.2 Periodical inspection

Following periodical inspection should be conducted by-annually or annually.

- 1) Precise inspection should be performed after electric/pneumatic shut-down and the status recorded. Repair should be performed if necessary.
- 2) Overhaul should be performed in the 2nd annual inspection and components exchanged as specified or if necessary. The overhaul should also be performed when the actuator operational cycle reaches 100,000 cycles even before two years from the date of last inspection.

## 4.3 Residual energy

Maintenance requiring actual operation of a system should be performed after pneumatic/electric shut-down and exhaustion of all residual electrical charge and compressed air from the system. Make sure the movable components do not move during the maintenance, and mechanically fix them if necessary for safety. Care should also be taken for components that may drop out during the maintenance operation and components with sharp edges to ensure safety.

## 4.4 Removing actuator

Before removing or disassembling the actuator, make sure to disconnect the power supply (electricity and compressed air) and release residual pressure in the equipment and piping thoroughly.

For single-acting type actuator make sure that the spindle is

positioned with the spring elongated.

For the actuator with manual operating mechanism also make sure that the spindle is positioned with the spring elongated.

When removing a spring unit of single-acting type, loosen the adjustment screw completely before removal, avoiding stopper or piston force to be applied to the screw.

## 4.5 Communication

If multiple persons are involved in the maintenance operation, keep all the personnel informed about the conditions including power-off, completion of residual pressure exhaustion, power-on, and resumption of air supply.

## ⑤ Actuator installation

### 1. Actuator installation site

Use of an actuator at the following sites requires compliances with special functional specifications and regulations. Consult our sales personnel in the planning process for anything unclear.

- 1) Operating conditions not within the specified range
- 2) Significant risk for users, properties, or environment is anticipated

Eg: Use for nuclear power plants, vehicles, medical components, components related to the Occupational Health and Safety Law and/or the High Pressure Gas Safety Law, etc.

# Users Instructions

## Caution ① Transport of actuator

### 1.1 Weight

Heavy-weight actuators should be transported with the aid of conveyer equipment. Actuator weight can be confirmed by referring to Konan Rotary Actuator Catalogue and product drawings. Qualified personnel should be responsible for the operation of forklift truck, crane, or slinging according to the regulations and company safety code.

Care should also be taken for transport of light-weight actuators not to cause actuator component deformation and other damage.

### 1.2 Dropping

During lifting or horizontal transportation of an actuator, handle the actuator carefully not to drop or damage.

### 1.3 Dust prevention

Plastic plug is attached to the actuator connection ports to prevent dusts and rusts from entering the actuator. Do not remove the plug until immediately before piping. If the plug is lost, take a protection measure with alternative cover.

### 1.4 Dust prevention for single-acting type

When a single-acting type actuator is used outdoors or at such a place where it is exposed to water splash or much powder dust, prevent the breathing port of spring cover from entry of water or dust.

Care must be taken not to close up the breathing port at installation.

## Caution ② Storage

### 2.1 Storage during transport

If an actuator is to be installed where it is exposed to wind and rain or other adverse environment, transport the actuator to the specified site just before installation. If the actuator is to be stored at the installation site by necessity, keep it packed and protect with a sheet cover. In such case make sure to shorten the storage period as much as possible.

### 2.2 Storage

An actuator should be stored as follows to prevent contamination and material deterioration.

- 1) Avoid high temperature and humidity as well as places with dusts and moisture.
- 2) If an actuator is to be stored for more than 1 year, keep it packed or provide equivalent protection.
- 3) Long-term storage may result in sticking of packings due to shortage of lubrication. In such cases, conduct pre-conditioning operation of the actuator before regular use.
- 4) After a long period of storage, permanent deformation, change of size, or deterioration of packings would be a concern. After such storage period, conduct an actuator operation test. If any abnormalities are found, perform an overhaul or exchange deformed/deteriorated components as appropriate and connection portions fastened tightly. After start of operation, inspect the connections in a periodical manner to check any loose parts or deformation and re-fasten screws.

## Warning ③ Surrounding environment

### 3.1 Vibration/shock

- 1) If an actuator is to be used in a place where it is exposed to excessive shock or vibration, confirm acceleration rate and other conditions before consulting our sales personnel.
- 2) If the actuator is used in a place where vibration is a concern, ensure the actuator is firmly fixed at the setting and connection portions fastened tightly. Particularly, if the actuator is to be used frequently, take into consideration the fatigue resistance.
- 3) After start of operation, inspect the connection portions in a periodical manner to check any loose parts or deformation and re-fasten screws. Loose parts may cause unintended motion of the actuator, significantly affecting operators and surrounding systems.

# Pneumatic Rotary Actuators and Systems

## General Handling Instructions and Precautions

### 3.2 Handling during installation

Rough handling of an actuator may diminish regular performance of the actuator. For example, riding on, hammering or dropping the actuator may cause damage and deformation of the actuator components. Slight deformation of the actuator body diameter will result in malfunction. Also, bending or deformation of spindle will damage packings, causing air leakage.

### 3.3 Surrounding environment

Environment surrounding an actuator should be considered carefully. Avoid places where the actuator is exposed to rain and wind, direct sunlight, salt, corrosive gas, chemical fluids, organic solvents, steam, etc. Corrosion resistance measure can be taken depending on the environment. Feel free to contact our sales personnel for details.

### 3.4 Working temperature

Use an actuator with specified range of ambient/working temperature and supply pressure.

- 1) Temperature of compressed air around an air compressor may become high, which may cause deterioration of packings or malfunction of the actuator.
- 2) In a place where temperature is close to 0°C, remove moisture in the compressed air with an air dryer. If the dehumidification is not performed, significant amount of moisture may freeze inside the actuator to cause malfunction.

## Warning Safety measures

### 4.1 Operation space

Secure sufficient operation space for safe installation and maintenance of an actuator. This should be considered sufficiently, since in many cases a pneumatic control system is installed after completion of a main system. Ensuring safety is the first and foremost priority.

### 4.2 Mechanical safety

- 1) Intrinsic safety  
Make sure to avoid significant damage to operators by contact with movable, heated or energized components (squashing, dragging, blow, cutting, burn, electric shock, etc.).
- 2) Safety measures  
Put protection cover to the spindle and other movable components during the system operation to prevent operators from approaching. Take utmost care not to insert arms, hands, or fingers into the system.
- 3) Safety system  
If setting of a protection cover or other safety measures cannot be taken due to the functional problem of the system, add equipment that prevents or stops operation of the actuator when people come closer.

### 4.3 Constraint during operation

Before connecting an actuator and a load, firmly fix the both in order to avoid unintended movement due to gravity or operational work.

### 4.4 Weight

See Section 1.1 of the Users Instructions.

### 4.5 Residual energy

See Section 4.3 of the Safety Precautions.

### 4.6 Other

- 1) Care should be taken for risks related to actuator system operation such as: sudden blowout of compressed air; unintended operation of the actuator due to residual pressure after exhaustion of air inside the system; and abrupt rotation of actuator just after restarting air supply.
- 2) Pressurize the exhaust side cylinder chamber before activation of the actuator. If the operation is started with the chamber filled in atmospheric pressure, the load will be abruptly rotated.

## Warning Use of actuator

### 5.1 Modification

Do not modify an actuator. Unexpected risk may arise.

### 5.2 Load connection

Install the actuator so that thrust load and transverse load are not applied to the spindle.

Apply an independent stopper to the rotational axis on the load side in order to prevent axial movement. (Do not use the spindle of the actuator as a stopper.)

Ensure that the load has sufficient insertion length into the spindle, or the mating surface pressure increases to enlarge clearance, which may cause failure in the load positioning.

### 5.3 Working pressure

Do not use the actuator with the pressure over the maximum working pressure, which may cause damage to the components or malfunction.

In order to ensure smooth operation and stable output torque, do not use the actuator with the pressure less than the minimum working pressure.

### 5.4 Dust prevention of single-acting type

When a single-acting type actuator is used outdoors or at such a place where it is exposed to water splash or much powder dust, prevent the breathing port of spring cover from entry of water or dust.

Care must be taken not to close up the breathing port at installation.

### 5.5 Disassembly of single-acting type spring ass'y

Never attempt to disassemble a spring ass'y of single-acting type actuator. If disassembled forcibly, internal parts may jump out. If any disassembly is necessary, contact our sales personnel.

### 5.6 Shock absorption using external shock absorber

Generally, shock-absorbing mechanism is not incorporated in the actuator. With the load with high motion energy (large mass and high operation speed), internal components of actuator may be damaged. In such case, it is necessary to slow down the operation speed or mount external rubber cushions or other shock absorbers.

External shock absorbers should have appropriate absorption characteristics as well as suitable connection surface and connection stand with sufficient strength and rigidity.

### 5.7 External operation

In the event it is necessary to rotate the actuator with spanners and other tools for system adjustment, do not apply static load over the maximum output torque to the spindle.

## Caution Actuator adjustment

### 6.1 Adjustment of rotation angle

Adjustment of rotation angle is made by an adjustment screw after loosening the locknut. Make sure to tighten the locknut after adjustment to secure the adjustment screw. Avoid stopper or piston force to be applied to the screw during adjustment.

### 6.2 Adjustment of rotation speed

As an actuator needs adjustment of rotation speed, install a speed control valve to restrict the exhausting air from the actuator port (meter-out control).

- 1) Do not reverse flow direction of a speed controller.
- 2) Konan standard SC6 series speed controller has an adjustment screw. When it is turned clockwise, the speed decreases to become zero (valve closed). When the screw is then turned counterclockwise, the actuator speed increases corresponding to the number of screw revolution.
- 3) For safety, fully close the speed controller before air supply, then pressurize and gradually increase the actuator speed using a directional control valve.
- 4) After adjustment, firmly fasten the locknut of adjustment screw.

## Caution Intermediate stop of actuator

Because of the small volume of movable parts, an actuator cannot be stopped intermediately by controlling with a 3-position closed-center type directional control valve. If necessary, an actuator with optional positioner should be selected. Consult our sales personnel for detailed specifications of the actuator with positioner.

## **Caution ⑧ Spray lubrication using a lubricator**

An actuator can be used without lubrication. 6.3 Selection of oilless solenoid valve

### 8.1 Overhaul of oilless actuator

- 1) Before overhaul of an actuator contact our sales personnel for grease used after the overhaul. Use specified grease after overhaul of an oilless actuator.
- 2) A greased oilless actuator can be lubricated but the grease will be exhausted. Although durability is enhanced after the lubrication, continual lubrication will be required.

### 8.2 Lubrication

- 1) Use JIS K 2213 (ISO VG32 or VG46) type turbine oil for lubrication using a lubricator.
- 2) Spray volume of a lubricator is determined by the number of oil drops (typically 0.03 cm<sup>3</sup> per drop or 1.5 to 2.5 drops per 1 m<sup>3</sup> of air).

### 8.3 Centralized lubrication

In principle 1 lubricator should be used for 1 actuator. Lubricating multiple actuators may result in uneven oil supply to each actuator, particularly if there are differences in the operation frequency, pipe length, size, and installation height of the actuators. By grouping the actuators with similar conditions, centralized lubrication can be achieved.

## **Reference ⑨ Actuator system control**

### 9.1 Sequence control

Follow the below steps for sequence control of an actuator.

- 1) Detect the position.
- 2) Interlock the control of other actuators in the system.
- 3) If operation is stopped in the middle of sequence, make sure to restart the operation from the stopped position safely. If impossible, manually control the actuator to return to the starting position.
- 4) Set a sequence starting position at which movable components do not move after air exhaustion.

### 9.2 Power failure and pneumatic pressure failure

- 1) In case of power failure or emergency stop of an actuator operation, ensure the actuator at operation stops or shifts to a safe position. Care should be taken not to damage personnel or equipment after recovery of the power failure or the system operation. Indicate procedure to recover power failure.
- 2) In order to complete a cycle operation even in case of pneumatic pressure failure, reserve sufficient amount of pneumatic pressure in an air tank.
- 3) In case of the system shut-down due to emergency stop or power failure, avoid damage to personnel or equipment when restarting the actuator operation after power recovery or system reset.

## **Warning ⑩ Clamp system**

If dropout of a workpiece due to pneumatic pressure drop in an actuator-driven clamp system is anticipated, use a single-acting type actuator.

## **Warning ⑪ Lifting system**

Do not use an actuator for elevators transporting people.

## **Warning ⑫ Residual pressure exhaustion**

Follow the below for exhaustion of residual pressure inside a pneumatic control system at installation or maintenance.

- 1) Use a manual control valve for exhaustion of residual pressure.
- 2) Place manometers, pressure switches, and other residual pressure indicators at each section with residual pressure.
- 3) In a sequence control system, make sure to centrally control all related residual pressure exhaustion. If this is impossible, indicate the place and switching condition of the

air exhaustion equipment with a tag.

- 4) If allowing separate maintenance of each cylinder chamber, install a 3-port manual valve or other residual pressure exhaustion valve at the inlet or outlet of the directional control valve.
- 5) In a system circuit using a check valve, pilot type check valve and closed-center directional control valve, exhaust residual pressure separately or indicate warnings for residual pressure, as air may be contained even the system is not in operation.
- 6) Indicate the residual pressure exhaustion valve in the system circuit drawing.

## **Reference ⑬ Circuit and piping**

### 13.1 Pressure drop

In a pneumatic control system with long pipes at the end or entrance of the system, sufficient pressure may not be supplied due to pressure drop. Piping thus should be designed properly, or supplementary air tank should be installed to secure supply pressure if the actuator is operated intermittently.

### 13.2 Air filtration

Air supplied to an actuator should be filtrated by a filter with nominal filtration rating of no more than 40 μm to remove solid contaminants. Exhaust liquid drain or oil through the filter or drain separator after sufficient cooling of the air. Exposure to contaminated, high temperature compressed air may deteriorate packings or other components, making the product life significantly shorter.

### 13.3 Piping

- 1) Do not remove the plastic plug and keep the actuator packed until just before piping in order to prevent dusts and rusts from entering the actuator during storage or installation. Use galvanized pipe for steel tube piping and remove dusts after screwing.
- 2) Before connection, clean the pipes by air flushing or washing to remove internal dusts, moisture, and oil.
- 3) If a seal tape is used for screwing, wrap the tape around twice or three times in a direction opposite to the screwing direction, leaving 1.5 to 2 threads from the screw edge.
- 4) For piping works using tapered male thread joints or steel tubes, use sealing materials such as seal tape and fasten to adhere tightly to the threads. Do not use wrenches and spanners that are excessively large for the joint or those with long extended handle. Do not step on the wrench/spanner to fasten the pipe. Excessive fastening may result in collapse of screws. In case of 6A to 25A (Rc1/8 to 1) size tapered male screws, 4 to 5 threads should be screwed. For operators with little experiences, an exercise before actual piping is recommended.

## **Caution ⑭ Special actuators**

For actuators with special specifications like below, consult our sales personnel and inform the conditions for use.

- 1) Use with carbon dioxide gas or nitrogen gas
- 2) Use under conditions with high/low temperature or high radiant heat
- 3) Use at a place with ozone or salt and underwater
- 4) Externally washed as part of a sanitary system

## **Warning ⑮ Disposal**

- 1) Do not incinerate an actuator for disposal. It may explode or emit poisonous gas.
- 2) Check the material of each component of an actuator with catalogue or operation manual for segregation disposal. Konan actuators do not include materials indisposable as general industrial waste.
- 3) Do not dispose single-acting type spring ass'y. Return the ass'y to Konan or contact our sales personnel. Forcible disassembly may cause dangerous dropping out of parts.

## Specifications

Bore size [mm]	φ 40	φ 50	φ 63	φ 80	φ 100	φ 125	φ 160
Operating fluid	Compressed air						
Operating pressure	0.3 ~ 0.7MPa						
Proof pressure	1.05MPa						
Operating temperature	- 5 ~ 60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)						
Output torque	Please refer to the "Table of Output Torque" (P22 ~ P24)						
Rotating angle	90°						
Operating speed	Max.90° /1s					Max.90° /2s	Max.90° /3s
Angle adjustment range	-		± 5° both end

## Output Torque

Double-Acting Type (TA2-0402D)

Single-Acting Type (TA2-0402R)

— Torque by compressed air  
- - - Torque by spring

### Output Torque (Double-Acting Type)

Operating pressure	Torque
0.3MPa	5.5 N·m
0.4MPa	8 N·m
0.5MPa	10 N·m
0.6MPa	12 N·m
0.7MPa	14 N·m

## Air consumption

Model Code	Air consumption
TA2-0402D	$0.11 \times \left( \frac{P+0.1013}{0.1013} \right) \times n$
TA2-0402R	$0.225 \times \left( \frac{P+0.1013}{0.1013} \right) \times n$

P = Operating pressure [MPa]    n = Number of cycle (one cycle = one reciprocation)

**Output Torque** N · m

● The values of torque shown below are obtained by calculation taking the frictional resistance into consideration.

**Double-Acting Type [Type D]**

Unit : N · m

Model code of Rotary actuator	Operating pressure MPa									
	0.3		0.4		0.5		0.6		0.7

## Torque Characteristic

Operating by Compressed Air

Returning by a Spring

## Air consumption

Double-Acting Type [Type D]

Model Code	A [L]	consumption [L]
TA2-050D	0.09	$2 \times A \times \left( \frac{P+0.1013}{0.1013} \right) \times n$
TA2-063D	0.17	
TA2-080D	0.33	
TA2-100D	0.68	
TA2-125D	1.36	
TA2-160D	2.78	

Single-Acting Type [Type R / Type L] (Spring Return)

Model Code	A [L]	B [L]	consumption [L]
TA2-050R (L)	0.09	0.25	$(A+B) \times \left( \frac{P+0.1013}{0.1013} \right) \times n$
TA2-063R (L)	0.17	0.50	
TA2-080R (L)	0.33	0.93	
TA2-100R2 (L2)	0.68	1.94	
TA2-125R2 (L2)	1.36	3.08	
TA2-160R2 (L2)	2.78	5.99	

A : Actuator displacement [L]  
 B : Spring cartridge displacement [L]  
 P : Operating pressure [MPa]  
 n : Number of cycle (one cycle = one reciprocation)

## With Speed Controller and Bypass Valve

Resin-made bypass valve with build-in speed controller, which is applicable to the NAMUR interface, is directly mounted in this type.

※ Only the Double-Acting Type is available

### Specifications

Bore size [mm]	φ 40	φ 50	φ 63	φ 80	φ 100	φ 125	φ 160
Operating fluid	Compressed air						
Operating pressure	0.3 ~ 0.7MPa						
Proof pressure	1.05MPa						
Operating temperature	- 5 ~ 60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)						
Output torque	Please refer to the "Table of Output Torque" (P22 ~ P24)						
Rotating angle	90°						
Angle adjustment range	-						± 5° both end

## With 5-Port Solenoid Valve

This type has a high-performance 5-port solenoid valve featured by compactness, large flow, less power consumption, and unlubricated service. As wide variety of options, including DIN connector and Waterproof connector, are available

### Specifications

Bore size [mm]	φ 40	φ 50	φ 63	φ 80	φ 100	φ 125	φ 160

**Single-Acting Type [Type R2] (Spring Return)**

## With Explosion-Proof Solenoid Valve and FR Unit

This type incorporates a 5-port solenoid valve in explosion-proof structure (d2G4) and FR unit.

### Specifications

Bore size [mm]	φ 40	φ 50	φ 63	φ 80	φ 100	φ 125	φ 160
Operating fluid	Compressed air						
Operating pressure	0.3 ~ 0.7MPa						
Proof pressure	1.05MPa						
Operating temperature	- 5 ~ 60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)						
Output torque	Please refer to the "Table of Output Torque" (P22 ~ P24)						
Rotating angle	90°						
Angle adjustment range	-						± 5° both end
Solenoid valve	Structure	Explosion-proof structure (d2G4)					
	Rated voltage	Please refer to the Model Code section.					
	Voltage tolerance	- 15 ~ + 10% of the rated voltage					
	Power consumption	AC-7.5VA (50Hz) 5.5VA (60Hz)、DC-4W					
	Protection class	IP65					

● Ex II BT4 explosion-proof solenoid valves are available. For details, contact us.

### Model Code

1 Bore size [mm]

## With Electric-Pneumatic positioner

This type is equipped with a compact Electric-Pneumatic positioner, which precisely controls rotating angle of the actuator. We provide two options available : CW Type turns clockwise to increment of the electrical signal, and CCW type turns vice versa.

### Specifications

Bore size [mm]	φ 63	φ 80	φ 100	φ 125	φ 160
Operating fluid	Compressed air				
Operating pressure	0.3 ~ 0.7MPa				
Proof pressure	1.05MPa				
Operating temperature	- 5 ~ 60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)				
Output torque	Please refer to the "Table of Output Torque" (P22 ~ P24) (The load torque is recommended not to exceed 50% of the valve in the output torque table.)				
Rotating angle	90°				
Angle adjustment range	± 5° both end				

● Use clean and fresh air. Adjust the air to be constant pressure suitable for use using a pressure reducing valve. If dust, moisture, oil, etc. are included in air to be used, it may cause troubles and the service life to be shortened. Remove them sufficiently.

### Characteristics of the Positioner

Input signal	4 ~ 20mA DC 250 Ω
Cam characteristics	Linear characteristics
Linearity	± 5% F.S
Hysteresis	2% F.S
Repeatability	3% F.S
Sensitivity	3% F.S
Seismic capacity	1% F.S
Air consumption	11L/min [ANR] (SUP 0.4MPa, Output pressure 75%)
Structure	Flame-proof enclosure construction : Exd II BT6
Main component material	Body, Cover : Aluminum

● Each performance value varies depending on load factor, etc.

### Model Code

#### 1 Bore size [mm]

φ 80	080
φ 100	100
φ 125	125
φ 160	160

#### 2 Operation type

Double-Acting Type	φ 40 ~ φ 160	D
Single-Acting Type (Clockwise rotation by spring)	φ 40 ~ φ 80	R
	φ 100 ~ φ 160	R2
Single-Acting Type (Counterclockwise rotation by spring)	φ 40 ~ φ 80	L
	φ 100 ~ φ 160	L2

#### 3 Control direction

Clockwise rotation by increased electrical signal (C · W)	C
Counterclockwise rotation by increased electrical signal (C · C · W)	A

## Operating principle

When input power is applied to the torque motor (1E), the armature (2Eb) moves in arrow A direction around the fulcrum plate spring (3). This movement causes the flapper (5) to be separated from the nozzle (4), the pressure of the nozzle back-pressure chamber (12) to decrease and the balance with the pressure chamber (11) to be lost. For this reason, the relay spool (13) pushes the port A (15a) open, which causes the lower cylinder pressure chamber (17e) to be connected to the exhaust port (9) and the stem (18) to be lowered. This movement is transferred to the feed-back lever (19), cam lever (20), range arm (23) and zero arm (26) to extend the feed-back spring (7) and move until the spring tensile strength balances with the absorption power of the torque motor (1E). Accordingly, the movement of the stem (18) in proportion to the input signal is obtained.

### Model Code

#### 1 Bore size [mm]

φ 63	063
φ 80	080
φ 100	100
φ 125	125
φ 160	160

#### 2 Operation type

Double-Acting Type	φ 40 ~ φ 160	D
Single-Acting Type (Clockwise rotation by spring)	φ 40 ~ φ 80	R
	φ 100 ~ φ 160	R2
Single-Acting Type (Counterclockwise rotation by spring)	φ 40 ~ φ 80	L
	φ 100 ~ φ 160	L2

#### 3 Control direction

Clockwise rotation by increased signal pressure (C · W)	C
Counterclockwise rotation by increased signal pressure (C · C · W)	A

## Operating principle

- (1a) Input chamber
- (1b) Pilot relay
- (2) Fulcrum plate spring
- (3) Flapper
- (4) Nozzle
- (5) Nozzle back-pressure chamber
- (6) Pressure chamber
- (7) Relay spool
- (8a) Port A
- (8b) Port B
- (9) Input chamber diaphragm
- (10) Fixed aperture
- (11) Pressure chamber diaphragm
- (12) Feed-back spring
- (13) Exhaust port
- (14a) Right cylinder chamber
- (14b) Left cylinder chamber
- (15) Stem
- (16a) A lever
- (16b) B lever
- (18) Cam
- (19) Bearing
- (20) Zero arm
- (21) Range arm
- (22) Roller shaft
- (23) Range adjuster
- (24) Zero adjustment knob
- (25) Seat adjuster

When input signal is applied to the input chamber (1a), the flapper moves in arrow A direction around the fulcrum plate spring (2). This movement causes the flapper (3) to be separated from the nozzle (4) and the pressure of the nozzle back-pressure chamber (5) to decrease, the balance with the pressure chamber (6) to be lost, and relay spool (7) to push the port A (8a) to open the air-intake valve seat. At the same time, in the port B (8b), the air-intake valve seat of the relay spool (7) is closed and the exhaust valve is opened. Supply pressure is fed from the OUT1. to the right cylinder chamber (14a) and from the OUT2. to the left cylinder chamber (14b) and finally vented to atmosphere via the exhaust port (13) to lower the stem (15). This movement is transferred to the B lever (16b), A lever (16a), cam (18), zero arm (20) and range arm (21) to extend the feed-back spring (12) and move until the spring tensile strength balances with the output of the input chamber. Accordingly, change in opening of the stem (15) in proportion to the input signal pressure is obtained. In balanced conditions at the point indicated by the signal, the respective air-intake valve seat and exhaust valve seat of the OUT1. and OUT2. are returned to the neutral position. In the conditions where loads are not applied to the right and left cylinder chambers, the pressure is set at the balance pressure (approx. 75% of supply pressure).

## 3 FR Unit ( Filter regulator )

### Specifications

Model code	TA2-FR、TA-FR-E ※ In case of φ 40, only TA2-FR is available.	
Operating fluid	Compressed air	
Operating pressure	Primary side (IN)	Max.1.0MPa
	Secondary side (OUT)	0.05 ~ 0.7MPa
Proof pressure	1.5MPa	
Allowable air leakage	Less than 15cm <sup>3</sup> /min (ANR) only for the relief valve section	
Operating temperature	- 20 ~ 60°C (Only for FR unit itself)	
Mass	Please refer to Page 99.	
Element filtration	5 μ m	
Pressure gauge	Not attached and will be shipped as an accessory.	

● Piping fittings are not attached and are shipped as an accessory.

### Model Code

TA2 - FR - 1

Type of Solenoid Valve connected to the piping

Pressure gauge, connecting nipples/elbows to solenoid are attached.

### Drain Discharge

● To discharge the drains, push the rod of the drain valve upwards.

#### 1 Type of Solenoid Valve connected to the piping

5-port solenoid valve	4N3S102K - ** (Return) 4N3S10BK - ** (Return)	No entry (Standard)
	4N3S102K - ** (Hold) 4N3S10BK - ** (Hold)	
Explosion-proof solenoid valve	4N4S102K - E ** (Return) 4N4S10BK - E ** (Return)	E
	4N4S102K - E ** (Hold) 4N4S10BK - E ** (Hold)	

## 4 Bypass valve with speed controllers

### Specifications

Model code	BPSC-08A
Operating fluid	Compressed air
Operating pressure	0.1 ~ 0.7MPa
Proof pressure	1.05MPa
Operating temperature	- 5 ~ 60°C (In case of - 5°C to + 5°C , ensure to be removed any water contained for prevention of freezing.)
Material	Resin (PPC)
Mass	Please refer to Page 99.

### Model Code

## BPSC – 08A

- Actuator-mounting screws are attached.

## 5 Indicator (Pointer and indication board)

### Specifications

Article No.	Name	Material	Quantity

Protection class	IP65			Paint color	Silver

### Switch Box Internal Configuration

### Change of the Output Signal of the Switch

The circuit configuration of the micro switch built in this device is of the SPDT (Single Pole Double Throw) with output signal of only NO as a standard. To change it to the NC output signal, follow the procedure given below :

- Remove the screws (two) securing microswitches (two) .
- Remove the fast-on connection terminals inserted in the NO terminal strips.
- Insert the fast-on connection terminals into the NC terminal strips.
- Secure the microswitches (two pieces) with screws (two) respectively.

### Model Code

## 8 Air-intake speed controller compatible with the NAMUR standards

### Features

- 1 Meter-in circuit
- 2 The mounting method to the actuator conforms to the NAMUR standards.

〈JIS Symbol〉

### Specifications

Effective sectional area	Controlled flow	10mm <sup>2</sup>
	Free flow	12.5mm <sup>2</sup>
Operating pressure		0.05MPa ~ 0.7MPa
Proof pressure		1.05MPa
Cracking pressure		Less than 0.05MPa
Operating temperature		- 5 ~ 60°C
Mass		約 0.21kg

Remarks) These specifications are subject to change depending on use conditions.

### Model Code

# SCTA2 – 02

## 9 Air-intake and exhaust speed controller compatible with the NAMUR standards

※ This product is included only in single-action type.

### Features

- 1 Speed control valve combining the meter-in and mater-out functions.
- 2 Attaching this controller to the single-acting oscillating actuator with spring enables the rotation speeds in rightward/leftward directions to be adjusted respectively by one unit.
- 3 The attaching time can be reduced greatly in comparison with piping the 2 speed control valves in series. Furthermore, it has effect to prevent the piping from being damaged due to external force.
- 4 The mounting dimensions to the actuator conform to the NAMUR standards.

〈JIS Symbol〉

### Specifications

Fluid	Compressed air
Operating pressure	0.3MPa ~ 0.7MPa
Proof pressure	1.05MPa
Operating temperature	- 5 ~ 60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)
Effective sectional area	4.9mm <sup>2</sup>
Cracking pressure	Less than 0.05MPa (JISB8376 <sup>-1994</sup> )
Mass	0.26kg

Remarks) These specifications are subject to change depending on use conditions.

### Model Code

In a double-acting type (D) rotary actuator with return type solenoid valve (S) mounted, standard operation is “counterclockwise rotation when solenoid is energized.” However, following the procedure below allows reverse operation, “clockwise rotation when solenoid is energized.”

#### How to convert the operation of 5-port solenoid valve (return type)

#### How to convert the operation of rotary actuator

- In a double-acting type actuator with return type solenoid valve mounted, standard operation is as described in page 30 (at shipment).
- If the operation of the solenoid and the rotary actuator should be reversed, turn over the pilot packing of the solenoid valve to set with the “NC” mark visible.

[Standard]

[Reversed]

## 2 Procedure for Connecting 5-port Explosion-proof (d2G4) Solenoid Valve

### How to pull the external lead wire in the terminal box

#### Conduit system

Use the thick steel conduit (JIS C8305) with parallel thread screw (JIS B0202) and connect it with the screw by over five threads.

For details of wiring, follow the USERS' GUIDELINES for Electrical Installations for Explosive Gas Atmospheres in General Industry.

If there is a risk for entry of corrosive gas, moisture, or water from the thread, for precaution, apply non-curing water-proof or rust-preventing agent such as liquid gasket to the thread before connecting screw.

#### ⚠ Warning

When fastening the thick steel conduit or lock nut for the thick steel conduit, use a spanner as shown in the above drawing to ensure no excessive force is applied onto the terminal box. Excessive force applied may impair the explosion-proof performance.

## Pressure-resistant packing system

Follow the under-mentioned procedure for cable wiring. Note that the sizes of the marked parts\* are different depending on the cable size.

## Electric connection

Use the attached solderless terminal V2-M4 (JST Mfg. Co., Ltd.) and the specified fitting YNT-1614 (JST Mfg. Co., Ltd.) for the connection work. Electric cable size should be 1.04 to 2.63 mm<sup>2</sup>.

## Opening/closing of the terminal box

Explosion-proof construction standard: The terminal box cover can be opened/closed only with a specified tool. When opening or closing the terminal box, use the special tool attached. Ensure to properly fit an angled edge plate into the slot of the cover and turn it as per shown.

Ex explosion-proof type: The terminal box cover can be opened/closed with spanners.

### **Warning**

Before opening/closing the terminal box or removing/mounting electric terminal, ensure to shut off the power source.

When wiring work is performed outdoors or in the area which is likely to be exposed to water, make sure to take protective measure to prevent entry of the rain water into the terminal box.

## How to Convert the Operation of 5-port Explosion-proof (d2G4) Solenoid Valve

**1**

Remove the solenoid valve from the rotary actuator or the mounting surface.  
(Remove two socket head cap screws A.)

**2**

Remove the pilot solenoid valve from the valve body.  
(Remove two socket head cap screws B.)

Note: With the manual button upper side the actuator rotates counterclockwise when energized.  
With the manual button lower side the actuator rotates clockwise when energized.

**3**

Half-turn the removed pilot solenoid valve and mount it again to the valve body.  
(Mount two socket head cap screws B.)

**4**

Loosen the set screw C (by 5 to 6 turns), half-turn the terminal box, and then fasten the set screw to secure the terminal box. Attach the solenoid valve to the actuator in reverse order.

**3** How to convert the operation of single-acting rotally actuator type R and type L < for your reference >

Operation of the single-type rotary actuator can be converted from R type (clockwise rotation by a spring force) to L type (counterclockwise rotation by a spring force) or vice versa by rearranging the spring unit section.

By exchanging the spring unit, the operation can be changed from R type (rotating clockwise by spring force) to L type (rotating counter-clockwise by spring force) or from L type to R type.

Note 1) If it is necessary to change the nameplate because of change in R/L type, contact our company.

Note 2) The only difference between R type and L type is the position of socket plug (Form R52).

When changing the operation, change the position of the socket plug.

**φ 50 ~ φ100**

**φ 125, φ160**

# KONAN®

## RTA2 Rotary Actuator

Bore size  $\phi 50/\phi 63$

Rack and pinion  
180° rotation type

### Features

- 1) Newly developed pneumatic rotary actuator for rotation operation by 180°
- 2) Rack and pinion driving system provides flat output torque.
- 3) The solenoid valve attachment interface is compatible with the NAMUR standards (VDI/VDE3845).

### Specifications

Bore size	$\phi 50$	$\phi 63$
Operating fluid	Compressed air	
Operating pressure	0.3MPa~0.7MPa	
Proof pressure	1.05MPa	
Fluid temperature	-5~60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)	
Output torque	6.4N·m (at 0.4MPa)	11.5N·m (at 0.4MPa)
Rotating angle	180°	
Operating speed	Max180°/1s	
Angle adjustment range	$\pm 5^\circ$ both end	

Reliable actuator technologies backed with experiences for a long time enables firm and safe automatic operations of any large-diameter valves.

For ideal rotation control

## Features

### Scotch yoke driving system

The scotch yoke mechanism which is compact yet allows high-efficient driving is employed. Both TA-200 and TW-250 exhibit the optimal torque characteristics for valve control requiring the maximum torque at the rotation beginning and final ends.

### Abundant optional devices

Abundant optional devices have been standardized. The total system helps valve automatic operations.

### Connection method

The yoke or coupling-free direct mount system is employed for connection to valves.

- TA-200 employs a female angle conforming to ISO standards.
- TW-250 employs a female key socket system conforming to ISO standards.

## Specifications

Operating pressure	0.4 ~ 0.7MPa		
Proof pressure	1.05MPa		
Fluid temperature	- 5 ~ 60°C (In case of 5°C or less, ensure to be removed any water contained for prevention of freezing.)		
Output torque	Please refer to the "Table of Output Torque" (P111)		
Rotating angle	90°		
Angle adjustment range	± 5° both end		
Rotating speed	Max.90° /2s	Max.90° /2s	Max.90° /3s
Mass	約 70kg (Double-Acting Type)	約 170kg (Single-Acting Type)	約 100kg (Double-Acting Type)

## Model Code

TA-200 **1** - F16 - 00

Operation  
system

TW-250D - F16 - 00

### 1 Operation system

Double-Acting Type	D
Single-Acting Type	R

## External Dimensions

### TA-200D

Unit : mm

External Dimensions

TA-200R

Unit : mm

TW-250D

Unit : mm

## Output Torque

### Double-Acting Type · Effective output torque

Unit : N · m

Model code of Rotary actuator	Operating pressure MPa							
	0.4		0.5		0.6		0.7	
	Break	Run	Break	Run	Break	Run	Break	Run
TA-200D-F16-00	1,196	679	1,490	848	1,792	1,018	2,081	1,188
TW-250D-F16	2,350	1,320	2,940	1,610	3,520	1,960	4,110	2,300

### Single-Acting Type (Spring Return) · Effective output torque

■ Air torque—The same as double-acting type/effective output torque (above table).

Unit : N · m

Model code of Rotary actuator	Torque (Spring)		
	Break	Run	End
TA-200R-F16-00	1,444	669	996

## Torque Characteristic

### Operating by Compressed Air

### Returning by a Spring

# What's d2G4 / Exd II BT4?

For explosion-proof construction of electric equipment, the construction standards and technical standards, specifying 6 explosion-proof constructions each, are established according to the application, type of explosive gas used, or location of the equipment. Such specifications are expressed in codes such as "d2G4" and "Exd II BT4." Each of the codes has the following meanings.

## d2G4

Explosion-proof construction standard for electric equipment

**d**

d	Flame-proof enclosure construction	Type of explosion-proof construction
O	Oil-immersion construction	
f	Pressurized apparatus construction	
e	Increased safety construction	
i	Intrinsic safety construction	
s	Special type of protection construction	

**2**

1	Propane etc.	Explosive class
2	Ethylene etc.	
3a	Water gas / Hydrogen	
3b	Carbon disulfide	
3c	Acetylene	
3n	All	

**G4**

G1	Over 450°C	Ignition degree (ignition temperature)
G2	300 to 450°C	
G3	200 to 300°C	
G4	135 to 200°C	
G5	100 to 135°C	

## Exd II BT4

Technical standards conforming to the international standards (Ex explosion-proof type)

**Ex**

d	Flame-proof enclosure construction	Type of explosion-proof construction
O	Oil-immersion construction	
p	Pressurized apparatus construction	
e	Increased safety construction	
ia	Intrinsic safety construction	
ib		
s	Special type of protection construction	
n	Type n construction	

**d**

IIA	Propane etc.	Gas or steam type
IIB	Ethylene etc.	
IIC	All	

**IIB**

**T4**

T1	450°C	Temperature class (surface max. temperature)
T2	300°C	
T3	200°C	
T4	135°C	
T5	100°C	
T6	85°C	

Explosive gas classification according to explosive class and ignition degree (construction standard)

Explosion class	Ignition degree				
	G1	G2	G3	G4	G5
1	Acrylonitrile Acetone Ammonia Carbon monoxide Ethane Acetic acid	Ethyl acetate Toluene Propane Benzene Methanol Methane	Ethanol Isopentyl acetate 1-Butanol Butane	Gasoline Dimethyl ether Hexane	Acetaldehyde Diethyl ether
	2		Ethylene Ethylene oxide		
3	a	Water gas Hydrogen			
	b				Carbon disulfide
	c		Acetylene		
	n	Water gas / Hydrogen / Acetylene / Carbon disulfide			

Note) Gray marked are applicable range of d2G4.

Explosive gas classification according to gas or steam type and temperature class (Ex explosion-proof type)

Gas or steam type	Temperature class					
	T1	T2	T3	T4	T5	T6
IIA	Acetone Ammonia Ethane Acetic acid Ethyl acetate Toluene	Benzene Methane 1-Butanol Butane Propane Methanol	Hexane	Acetaldehyde Trimethylamine		
IIB	Acrylonitrile Carbon monoxide	Ethanol Ethylene Ethylene oxide	Dimethyl ether	Diethyl ether		
IIC	Water gas Hydrogen	Acetylene				Carbon disulfide

Note) Gray marked are applicable range of Exd II BT4.
