

# Why You Shouldn't Strip and Wax Polished Concrete Floors

Knowing how to properly care for your facility's concrete floors can help increase its longevity, durability and maintain a spotless appearance.

**25%**

Wax molecules are large, so when you wax a floor, these large molecules fill the floor's grooves, creating a flat level surface with little to no traction. More than 25% of injuries sustained across all industries are caused by slips, trips, and falls.

**2to5**

Experts agree that concrete flooring should be sealed every 2-5 years to preserve and protect the floor rather than stripping and waxing.

Stripping and waxing requires extensive labor and is usually performed twice a year. There are also product and equipment costs to consider. Over a few years, the cost of waxing adds up.

The average cost to strip and wax floors can be as high as \$2.25 sq/ft. Expenses are affected by the type of finish, the condition of the floor, the time that it takes to complete and the amount of space that needs to be restored.

Ameripolish's SmartFloor MaintenanceSystem is designed specifically with advanced technology for maintaining polished concrete floors without damaging them or becoming economically demanding over time.

Designed for use on walk-behind or ride-on auto-scrubbers.

Innovative composite resin abrasive technology.

Easy to use color-coded pad system allowing simple swapping in/out of desired pads.

Lifetime flooring maintenance support.

Made in the USA.
