Surface preparation: The relative humidity of the air should be maximum 80%, the ambient temperature should be 41 - 95°F/15 - 35°C and the surface temperature to be applied should be at least 41°F/5°C. It should not be applied in rainy weather. For good adhesion, surface cleaning should be done very well. Any kind of oil, dust, dirt, rust and similar substances on the surfaces to be applied between the krystal klar and the floor which may prevent the liquid glass from sticking to the surface should be completely cleaned. In tile, ceramic applications, if existing joint fillings were worn away, they should be renewed. The sanded surface provides better mechanical properties for liquid glass application and helps to better adhesion of the krystal klar to the surface.

Application method: Before application, the two components must be mixed thoroughly and at the given ratios. The two components can react only when the mixture is uniform and complete. The number of floors to be applied for the best performance is indicated in the table below.
