IDENTIFICATION OF MACHINES

Each Union Special machine is identified by a Style number on a name plate on the machine. Style numbers are classified as standard and special. Standard Styles numbers have one or more letters suffixed, but never contain the letter "Z". Example: "Style 57700 L". Special Style numbers contain the letter "Z". When only minor changes are made in a standard machine, a "Z" is suffixed to the Standard Style number. Example: "Style 57700 LZ".

Styles of machines similar in construction are grouped under a Class number which differs from the Style number, in that it contains no letters. Example: "Class 57700".

APPLICATION OF CATALOG

This catalog applies specifically to the Standard Styles of machines as listed herein. It can also be applied with discretion to some Special Styles of machines in this Class. Reference to direction, such as right, left, front, back, etc., are given from the operator's position while seated at the machine. Operating direction of handwheel is toward the operator.

STYLES OF MACHINES IN CLASS 57700

Advanced High Speed, Two Needle, One Looper, Plain Feed Flat Bed Machines, Medium Throw, Needle Bearing Needle Bar Drive, Light Weight Presser Bar and Needle Bar Driving Mechanism, Single Reservoir Enclosed Positive Automatic Lubricating System, Filtered Oil Return Pumps for Head and Base, Needle Bearings and Bronze Bearings for Feed Bar and Feed Rocker Shafts, Greased and Sealed. Lateral Looper Travel, Single Disc Take-up, Larger Handwheel and Improved Belt Guard. Prepared for use with Knee Press for Presser Foot Lifter, Equipped with Disc Thread Tensions, Maximum Work Space to Right of Needle Bar 8 1/4 Inches.

57700 L For hemming sides and bottoms of bathrobes, and for similar operations on medium to medium heavy weight woven fabrics. Standard gauges Nos. 12 and 16. Seam specification 406-EFa-1 inverted. Type 128 GAS needle. Maximum recommended speed 6000 R. P. M.

57700 N For attaching elastic bands in long lengths, garment lengths, or with ends joined, to rayon, silk, cotton, nylon and wool, flat, warp, and ribbed knit garments, and for similar operations on light to medium weight material. Automatic stretching device and spool holder for elastic. Standard gauges Nos. 8, 12 and 16. Seam specification 406-LSb-1 inverted. Type 121 GBS needle. Maximum recommended speed 6000 R. P. M.

NEEDLES

Each Union Special needle has both a type and size a number. The type number denotes the kind of shank, point, length, groove, finish and other details. The size number, stamped on the needle shank, denotes largest diameter of blade, measured in thousandths of an inch, midway between shank and eye. Collective, type and size number represent the complete symbol, which is given on the label of all needles packaged and sold by Union Special.

To have needle orders promptly and accurately filled, an empty package, a sample needle, or the type and size number should be forwarded. Use description on label. A complete order would read: "1000 needles, Type 121 GBS, Size 80/032".

NEEDLES (Continued)

The type numbers of the needles recommended for each style of machine covered by this catalog are given in the machine style description. Other needles are available, but the ones indicated are those recommended to produce the most satisfactory results. The type numbers of the recommended needles together with their descriptions, and the sizes available are listed below:

<u>Type No.</u>	<u>Description and Sizes</u>
121 GBS	Round shank, round point, short, single groove, struck groove, spotted, ball point, chromium plated-sizes 025, 027, 75/029, 80/032, 90/036, 100/040.
128 GAS	Round shank, round point, short, double groove, struck groove, ball eye, spotted, chromium plated-sizes 80/032, 90/036, 100/040, 110/044, 125/049, 140/054, 060, 067.

Selection of proper needle size is determined by size of thread used. Thread should pass freely through needle eye in order to produce a good stitch formation.

Success in the operation of Union Special machines can be secured only by use of needles packaged under our brand name, *Union Special* which is backed by a reputation for producing highest quality needles in materials and workmanship for more than three-quarters of a century.

THREADING AND OILING DIAGRAM

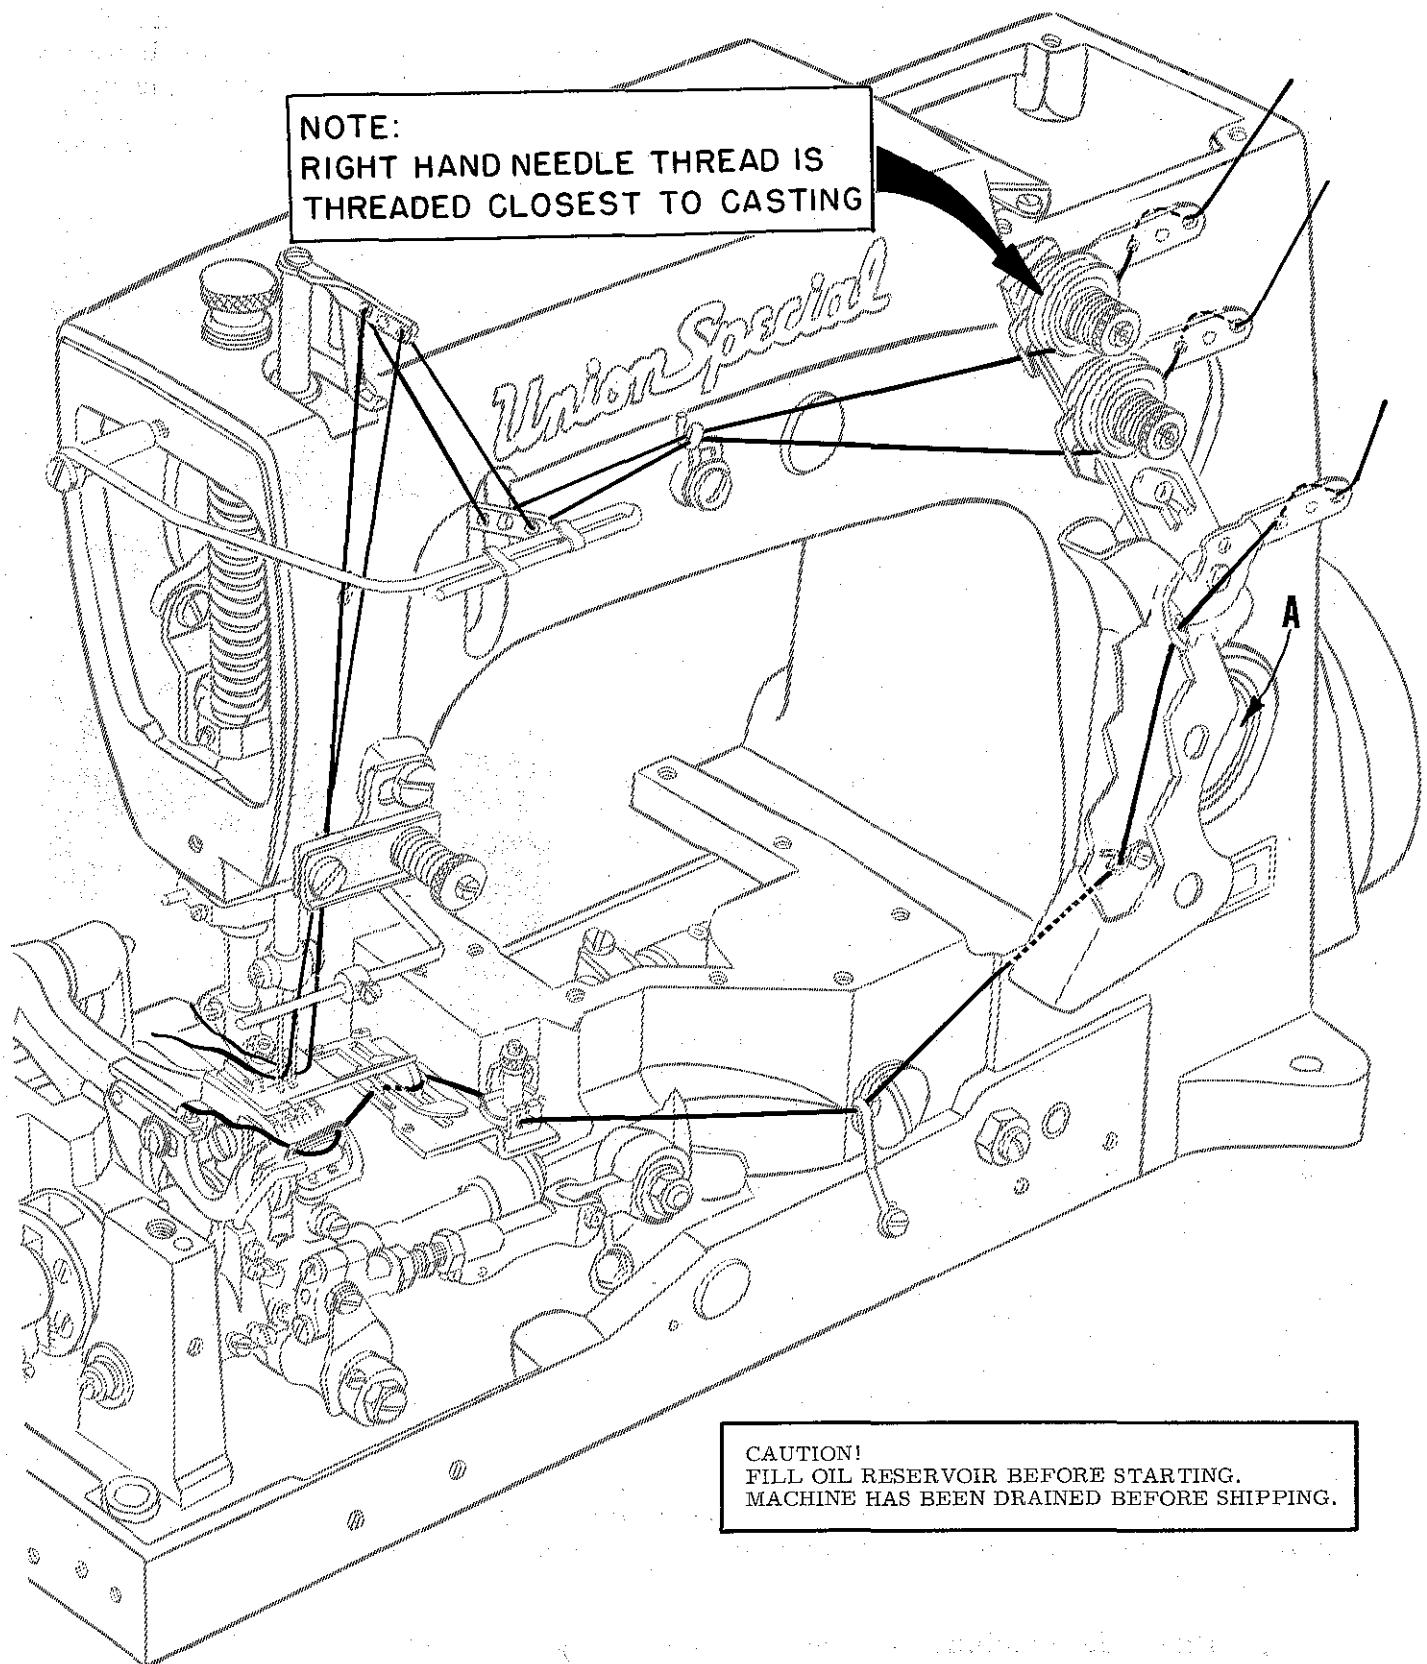

Fig. 1

INSTRUCTIONS FOR MECHANICS

LUBRICATION

CAUTION! Oil has been drained from the main reservoir before shipment, so the reservoir must be filled to the proper level as indicated on oil gauge (A, Fig. 1) before beginning to operate. Run machine slowly for several minutes to distribute the oil to the various parts. Full speed operation can then be expected without damage.

RECOMMENDED OIL

Use a straight mineral oil of a Saybolt viscosity of 90 to 125 seconds at 100° Fahrenheit in the main reservoir. This is equivalent to Union Special specification No. 175. Fill main reservoir at plug screw in upper crank chamber cover (A, Fig. 2) and check oil level at gauge (B). Oil is at maximum level when needle is in yellow band marked "Full". Oil should be added when needle is in yellow band marked "Low". Recommended grease No. 28604 P (See Page 10).

CAUTION! It is important that these machines not be over filled.

It is recommended that a new machine, or one that has been out of service for an extended period be lubricated as follows: Remove the head cover, clean out lint and directly oil the needle bar link and the needle bar. Replace head cover as no further hand oiling will be required. Run machine slowly for several minutes to distribute oil to the various parts.

For machines in operation check the oil for dirt and lint deposits at reasonable intervals. If dirty, change the oil. An oil change is recommended every 2000 operating hours. Oil may be drained from main reservoir by removing plug screw (C, Fig. 2) located below the cloth plate at front of the machine, or by removing the lower crank chamber cover, located at the back of machine.

NOTE: Looper avoid and feed lift eccentrics receive oil thru the mainshaft, so when assembling be sure oil holes in the eccentric line up with oil holes in mainshaft when spot screw is in time spot. See paragraph on "Changing Stitch Length" for repacking feed rocker sealed bearings.

OIL GAUGE

The oil gauge is set at the factory to show the proper oil level in the reservoir. Should an adjustment become necessary, however, the following steps should be followed:

1. Place the machine upright on a level table or bench.
2. Remove the oil reservoir plug screw (C, Fig. 2) and tip machine forward to drain oil from the reservoir.
3. Make sure all oil is drained from main reservoir.

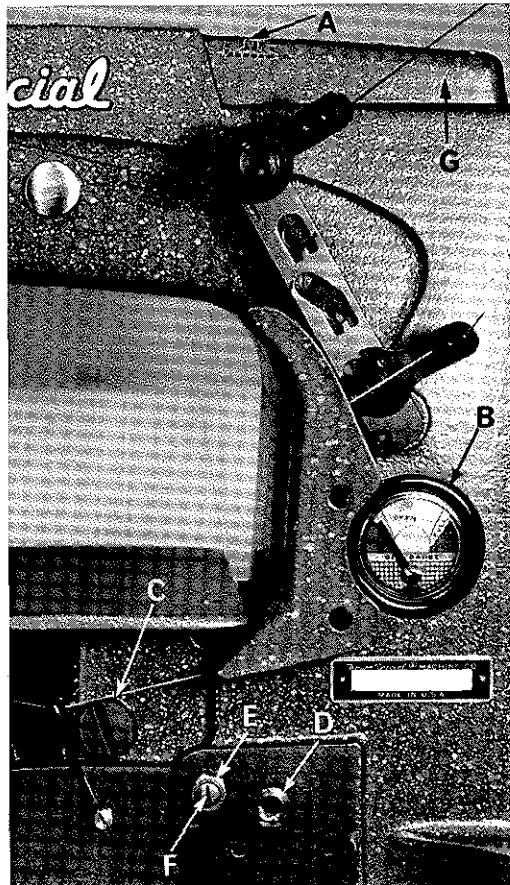

Fig. 2

OIL GAUGE (Continued)

4. Remove lower crank chamber cover, located at the back of the machine.
5. Fill main reservoir to a level even with the bottom contour of the knee press shaft bushing (D, Fig. 2).
6. Loosen lock nut (E) on calibrating screw (F), and turn the screw to the left or right until the gauge needle rests in the middle of the yellow band marked "LOW".
7. Tighten lock nut (E) and replace plug screw (C).
8. Add oil so that gauge needle rests in the middle of the yellow band marked "FULL".

NEEDLE LEVER BEARING OILER

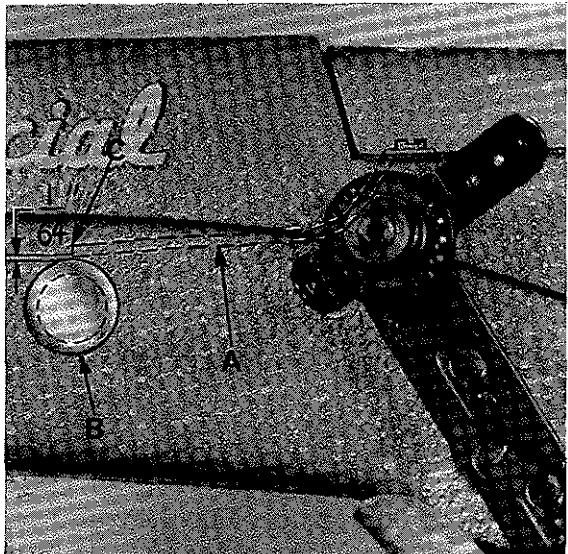

Fig. 3

Remove the head cover and upper crank chamber cover (G, Fig. 2). Check position of needle lever bearings oiler(A, Fig. 3) located inside the arm casting, below the upper crank chamber cover, which lubricates the needle lever stud (B). Make sure it is tilted downwardly and that its delivery end (C) contacts the inside wall of the bed casting at the back, just above the notch of the needle lever shaft stop collar. (Do not allow the oiler to rest on the needle lever.) Allow $1/64$ inch clearance as in Figure 3.

ALIGNING THE NEEDLE BAR

Align the needle bar (A, Fig. 4) and set to height, using the proper test pins and test plate of the right gauge.

See chart below:

Machine Style	Test Plate No.	Right Test Pin No.	Left Test Pin No.
57700 L-12	698 AV-12	699 R-12	699 L
57700 L-16	698 AV-16	699 D	699 L
57700 N-8	698 BB-8	699 R-8	699 L
57700 N-12	698 BB-12	699 R-12	699 L
57700 N-16	698 BB-16	699 D	699 L

Insert test pin No. 699 L in the left seat of the needle holder and the proper right hand test pin (see chart) should be inserted in the right needle seat. Now assemble test plate to machine using the throat plate attaching screws. The needle bar is located properly if the test pins align with the holes in the test plate and the height of the needle bar is correct when the shoulder of the test pins rest on the test plate, when the needle is at its lowest position.

If test plate and test pins are not available, insert a new set of needles (Type and Size as required) and align the needle bar so that the needles correspond with the vertical face of the needle guard. To turn needle bar, loosen needle bar clamp screw (B, Fig. 4) and turn bar as required. Tighten clamp screw.

SYNCHRONIZING LOOPER AND NEEDLE MOTIONS

Insert the looper in the looper rocker and turn handwheel in operating direction until the point of the looper (A, Fig. 5), moving to the left is even with the left side of right needle (B). Note the height of the eye of the needle with respect to the looper point, then turn handwheel in the reverse direction until the looper point again moves to the left, and is even with the left side of the right needle. If the motions synchronize, the height of the eye of the needle with respect to the looper point will be the same. A variation of .005 inch is allowable. If the distance from the eye of the needle to the point of the looper is greatest when the pulley is turned in the operating direction, move the looper drive shaft synchronizing stud (C) to the rear. Moving it in the opposite direction acts the reverse.

Moving of the looper drive lever shaft synchronizing stud is accomplished as follows: Loosen the clamp screw (D, Fig. 5) of the looper drive lever. To move stud to rear (away from operator), a light tap with a small hammer directly on the stud, is all that is required. To move stud forward (toward operator), remove the cloth plate, throat plate support, oil reservoir top cover and oil reservoir back cover, then, a light tap on the looper drive lever rocker shaft, toward the operator, is all that is required. Then, using the looper drive lever to take up the end play between the looper drive lever rocker shaft and its synchronizing stud, tighten the looper drive lever on the shaft, using screw (D, Fig. 5).

With the looper at the extreme right end of its travel, check the location of the center line of the right looper connecting rod bearing, using gauge No. 21227 CX. Remove nut (E, Fig. 5) and place hole in gauge over threaded stud. The left end of the gauge should locate against the right side of the looper rocker cone (F). If adjustment is necessary, loosen the clamp screw (D) and reposition the looper drive lever (G) as required. Tighten clamp screw. If gauge is not available setting can be checked with a scale. The distance between the center line of the looper rocker cone and the center line of the looper lever stud should be $4 \frac{1}{16}$ inch (Fig. 6).

SETTING THE LOOPER

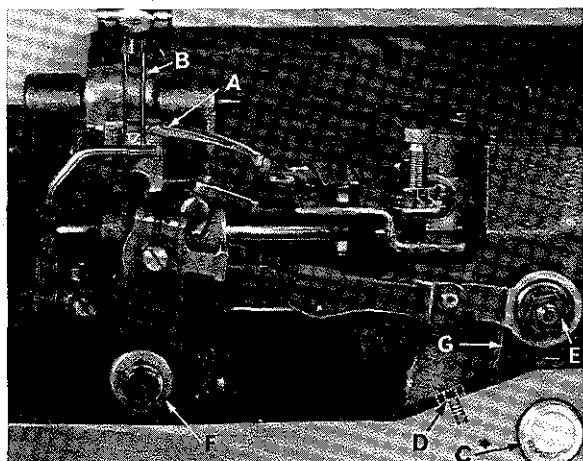

Fig. 5

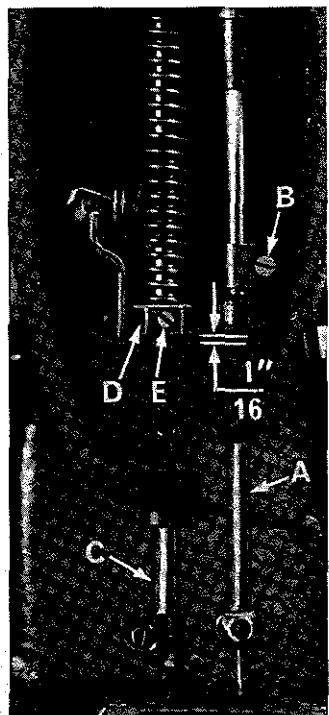

Fig. 4

Insert a new needle in the right needle seat, type and size as specified. If the looper gauge is $\frac{1}{4}$ inch, for example, set the looper (A, Fig. 6) so the distance from the center of the right needle (B) to the point of the looper is $\frac{1}{4}$ inch, when the looper is at its farthest position to the right. Looper gauge No. 21225- $\frac{1}{4}$ (C) can be used advantageously in making this adjustment. Refer to chart on the following page for needle Type, looper gauge setting and looper gauge number for the various styles of machines. If adjustment is required, loosen nut (D) (it has a left hand thread) and nut (E) on connecting rod (F), turn the connecting rod forward or backward to obtain the $\frac{1}{4}$ inch dimension. Retighten both nuts, first nut (E). Then nut (D). Make sure the left ball joint is in vertical

position and does not bind after adjustment.

SETTING THE LOOPER (Continued)

Machine Styles	Needle Type	Looper Gauge Setting	Looper Gauge Number
57700 L-12	128 GAS	7/32"	21225-7/32
57700 L-16	128 GAS	3/16"	21225-3/16
57700 N-8	121 GBS	1/4 "	21225-1/4
57700 N-12	121 GBS	7/32"	21225-7/32
57700 N-16	121 GBS	3/16"	21225-3/16

The looper is set correctly in line-of-feed, if, as it moves to the left, behind the needle, its point (A, Fig. 7) brushes, but does not pick at the rear of the needle (B).

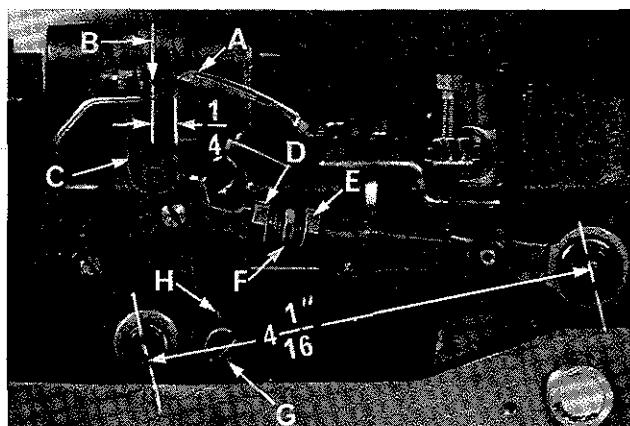

Fig. 6

with the looper point flush with the left side of the left needle. If adjustment is necessary, loosen screw (B, Fig. 4) and move needle bar (A) up or down as required and retighten screw. Care should be taken not to disturb the alignment of the needle bar when moving the needle bar either up or down.

NOTE: The height should be right if test plate and test pins were used to align needle bar.

All Needles are to have equal clearance on the right and left sides of needle slots in throat plate. The descending needles must be deflected alike on the back of the looper.

SETTING THE FEED DOG

Set the feed dog (A, Fig. 8) in the throat plate (B) so there is equal clearance on all sides. See that the tips of the teeth extend the depth of a tooth or approximately $3/64$ inch above the throat plate and are parallel with the throat plate at high point of travel. Adjust the supporting screw (C), under the feed dog, to maintain this setting. Screw (D) is used to hold feed dog in position.

If feed dog teeth are not parallel with the throat plate, loosen nut (A, Fig. 9) and turn screw (B) clockwise to lower the front teeth, and counterclockwise to raise the front teeth. Retighten nut when feed dog is set properly.

CAUTION: See that there is sufficient space between underside of feed dog and top of looper.

If adjustment is necessary, loosen lock screw (G, Fig. 6) and turn stop screw (H) as required. Turning stop screw clockwise sets the looper to the rear and turning it counterclockwise acts the reverse. Holding looper to the front while making this adjustment may prove helpful. Tighten lock screw when setting is obtained and recheck the adjustment. Now insert another needle in the left needle seat.

SETTING HEIGHT OF NEEDLE BAR

The height of the needle (B, Fig. 7) is correct when the top of its eye is $3/64$ inch below the underside of the looper, side of the left needle. If adjustment is

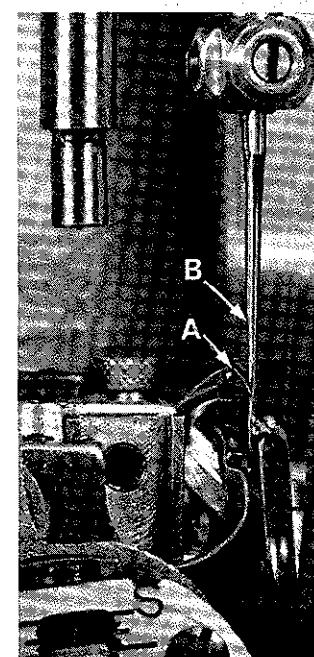

Fig. 7

SETTING THE FEED DOG (Continued)

Should it be necessary to move the feed dog to the left or right, loosen screws (A, Fig. 10) which hold the feed rocker (B) onto the feed rocker shaft (C), and move feed rocker to desired position and retighten screws. Make sure the feed rocker arm (D) does not bind after making this adjustment.

When the handwheel is turned in the operating direction the feed dog should have equal clearance on both ends of the throat plate slots with feed travel set to desired stitch length.

Should it be necessary to move the feed dog forward or backward, loosen nut (E, Fig. 10) which clamps the feed rocker arm to the feed rocker and move the feed rocker forward or backward as needed and retighten nut.

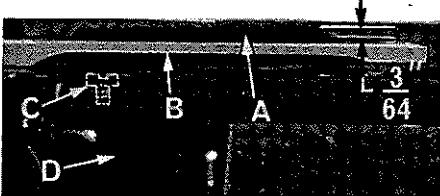

Fig. 8

CHANGING STITCH LENGTH

Set the stitch to required length. This is accomplished by loosening the locknut (F, Fig. 10) 1/2 turn (it has a left hand thread) on the end of the stitch regulating stud and turning the stitch adjusting screw (G) located under the left end of the cloth plate, in the head of the main shaft (H), which is marked with "L" and "S". Turning the screw clockwise shortens the stitch (moves stitch regulating stud toward the "S") and turning it in a counterclockwise direction lengthens the stitch (moves stitch regulating stud toward the "L"). Retighten the locknut securely. To prevent destructive damage to the feed drive bearing, the Key screw (J) must engage the "U" shaped key slot in the ferrule (K).

NOTE: Any change in stitch length will necessitate a corresponding change in the rear needle guard setting.

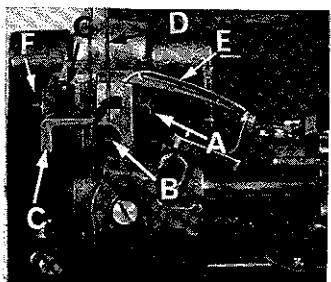

Fig. 9

The feed rocker assembly may require lubrication or repair after years of operation. This can be accomplished as follows: Loosen nuts (E, F, Fig. 10) and remove nut (F). Remove feed rocker arm (D) from machine by rocking slightly. Loosen screws (A) and remove stop collar on right end of shaft (C). The shaft can now be withdrawn. Loosen Allen screw (L) and remove shaft (M). Now, repack bearings.

When packing bearings the parts must be clean and grease should be applied directly from the tube to avoid contamination. Tube of grease can be supplied under the part number 28604 P.

Greased bearings are located at (N, P, Fig. 10). If grease sealed bearings are replaced they should be pressed in flush with the casting. To assemble, reverse the procedure described in the previous paragraph. Start tapered end of shafts first, twisting slightly when entering the grease seals to prevent damage. Check for proper adjustment of feed dog as described under "Setting the Feed Dog". Also check to see that there is no binding at any point.

SETTING THE REAR NEEDLE GUARD

Set the rear needle guard (C, Fig. 9) horizontally so that it does not quite contact the rear of the right needle (D) when at its most forward point of travel. A clearance of .005 inch is permissible. It should be set as low as possible, yet have its vertical face approach within about 3/64 inch of the needle, until the point of the looper (E), moving to the left, is even with the needle. To move needle guard forward or backward, merely loosen screw (F), move needle guard as required, and retighten screw. To raise or lower needle guard, loosen screw (F), and turn screw (G) clockwise to lower needle guard and counterclockwise to raise it. Retighten screw (F) after guard is properly set.

NOTE: A change in stitch length will require a change in rear needle guard setting.

SETTING FRONT NEEDLE GUARD

Set the front needle guard so that it pushes the left needle back toward the path of the looper as it moves behind the needle. The looper may brush but not pick at the left needle. It should be set as low as possible, yet have its vertical face push the left needle until the point of the looper is just past the left side of the left needle. The front needle guard should not contact the rear needle guard or right needle at any time. To move guard forward or backward, merely loosen screws (A, Fig. 11), move needle guard as required and retighten screws. To raise, lower or rotate needle guard, loosen screws (B), move guard and retighten screws after guard is properly set.

NOTE: A change in stitch length will NOT require a change in front needle guard setting.

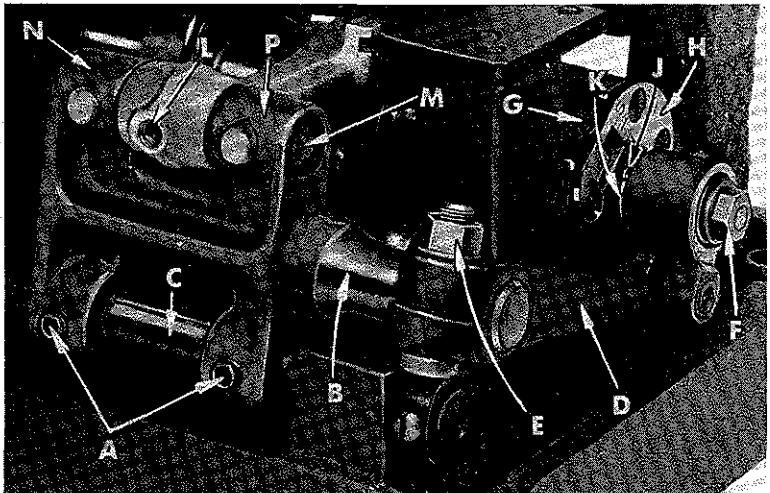

Fig. 10

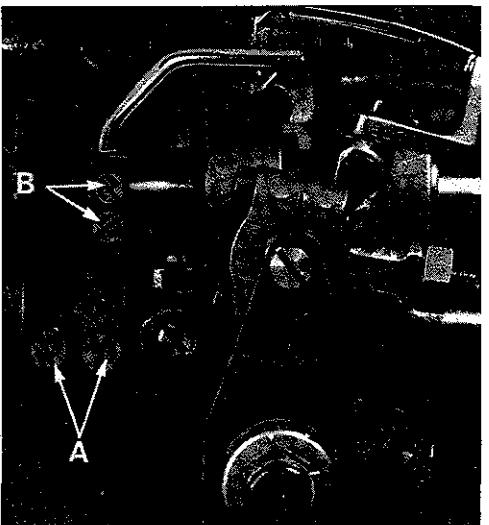

Fig. 11

THREAD TENSION RELEASE

The thread tension release is set correctly when it begins to function as the presser foot is raised to within $1/8$ inch of the end of its travel and is entirely released when the presser foot has reached its highest position.

If adjustment is needed, loosen tension release lever screw (A, Fig. 12), located at the back of the machine and move tension disc separator as required. Retighten screw. After adjustment there should be no binding at any point.

SETTING HEIGHT OF PRESSER BAR

The height of the presser bar (C, Fig. 4) is set correctly if it is possible to remove the presser foot when the foot lifter lever (B, Fig. 12) is fully depressed. Also there should be approximately $1/16$ inch clearance between lower surface of the presser bar connection and guide (D, Fig. 4) and the bottom surface of head opening in the bed when the foot lifter lever is released and the presser foot resting on the throat plate, with the feed dog down below the throat plate.

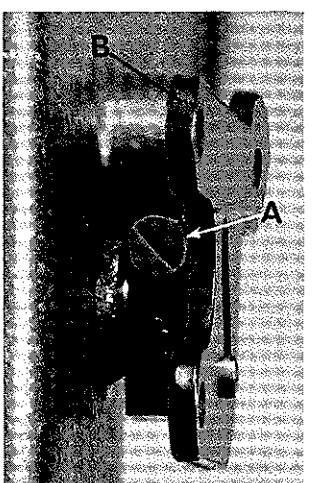

Fig. 12

If adjustment is needed, turn handwheel in operating direction until the needle bar is in the low position. Loosen screw (E). Then, while holding presser foot down on the throat plate surface, pry up presser bar connection and guide with a screw-

SETTING HEIGHT OF PRESSER BAR (Continued)

driver to obtain the 1/16 inch setting and tighten screw. Check setting by turning handwheel so that needle bar is in its high position and see if presser foot can be removed as mentioned in previous paragraph.

SETTING NEEDLE THREAD TAKE-UP WIRE AND FRAME EYELET

Set the needle thread take-up wire (A, Fig. 13), located adjacent to the needle bar thread eyelet (B), so that its upper surface is even with the top of the holes in the needle bar thread eyelet when the needle bar has completed its downward stroke. Lower this setting for a smaller needle thread loop, and raise it for a larger loop. Set the needle thread frame eyelet (C) so that the eyelet hole is 3/4 inch above the attaching screw (Fig. 13).

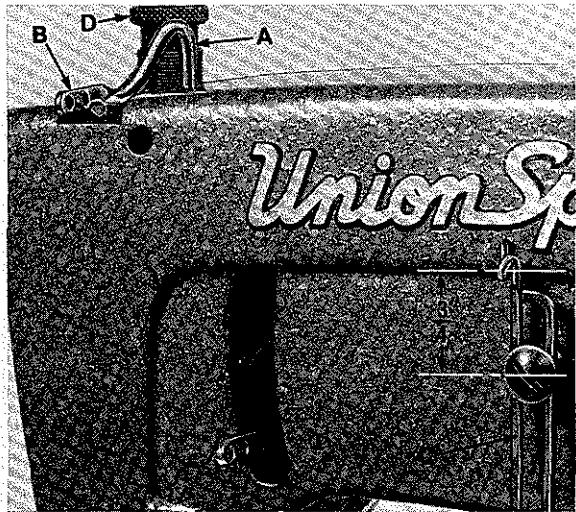

Fig. 13
to steady the thread.

THREADING

Draw the looper and needle threads into the machine and start operating on a piece of fabric. Refer to threading diagram (Fig. 1) on page 5, for manner of threading these machines.

THREAD TENSIONS

Pull the needle thread through the eyelets and set the needle tension at 3 ounces or just sufficient tension to produce uniform stitches on the under surface of the fabric.

The looper thread tension is applied at the cast-off support tension disc assembly, and the adjusting nut should be set so that the tension on the looper thread is just sufficient

SETTING LOOPER THREAD TAKE-UP

The looper thread take-up is not spotted on the main shaft and consequently can be set to compensate for varying conditions. It is set correctly when the looper thread is just cast off the highest lobe of the take-up when the points of the needles are clearly visible below the under side of the looper. This should be centered in slot of cast-off plate and cast-off plate support.

PRESSER FOOT PRESSURE

Regulate the presser spring regulating screw (D, Fig. 13) so that it exerts only enough pressure on the presser foot to feed the work uniformly when a slight tension is placed on the fabric. This is the knurled screw, located directly behind the needle bar in the head of the machine. Turning it clockwise increases the pressure, counter-clockwise acts the reverse.

TORQUE REQUIREMENTS

Torque (measured in inch-pounds) is a rotating force (in pounds) applied through a distance by a lever (in inches or feet). This is accomplished by a wrench, screw driver, etc., Many of these devices are available, which when set at the proper amount of torque will tighten the part to the correct amount and no tighter.

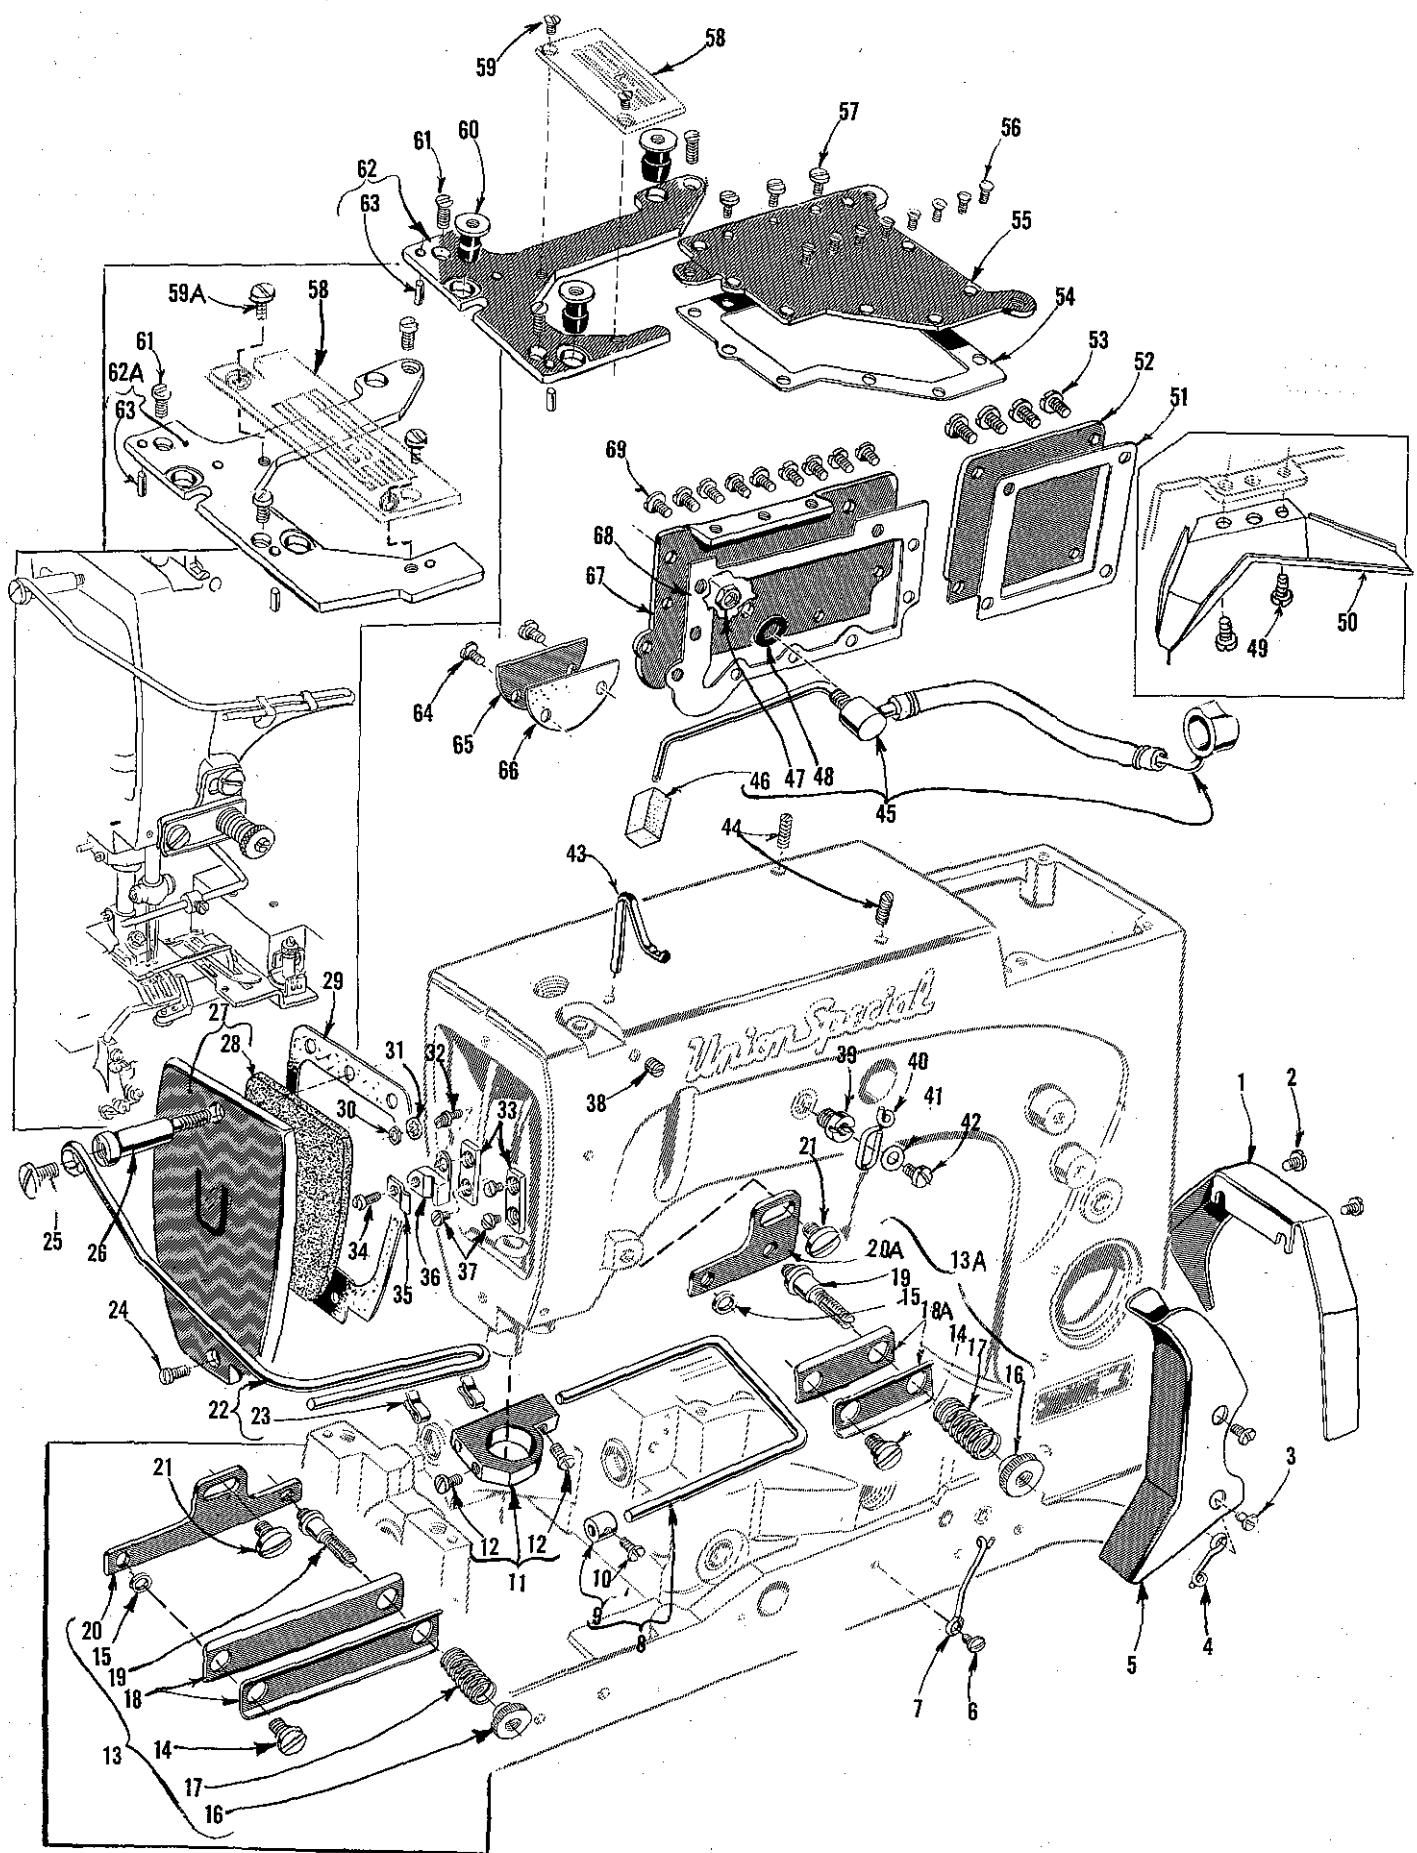

All straps and eccentrics should be tightened to 19-21 inch-pounds, unless otherwise noted. All other nuts, bolts, screws, etc., should be tightened by hand as tightly as possible, unless otherwise noted.

The screws requiring a specific torque, will be indicated on the picture plates.

Before this machine left the factory it was adjusted and inspected to give you the utmost satisfaction and durability at all times. If, however, the machine has been readjusted and is not sewing properly, see the chart below for suggestions which may prove beneficial to you.

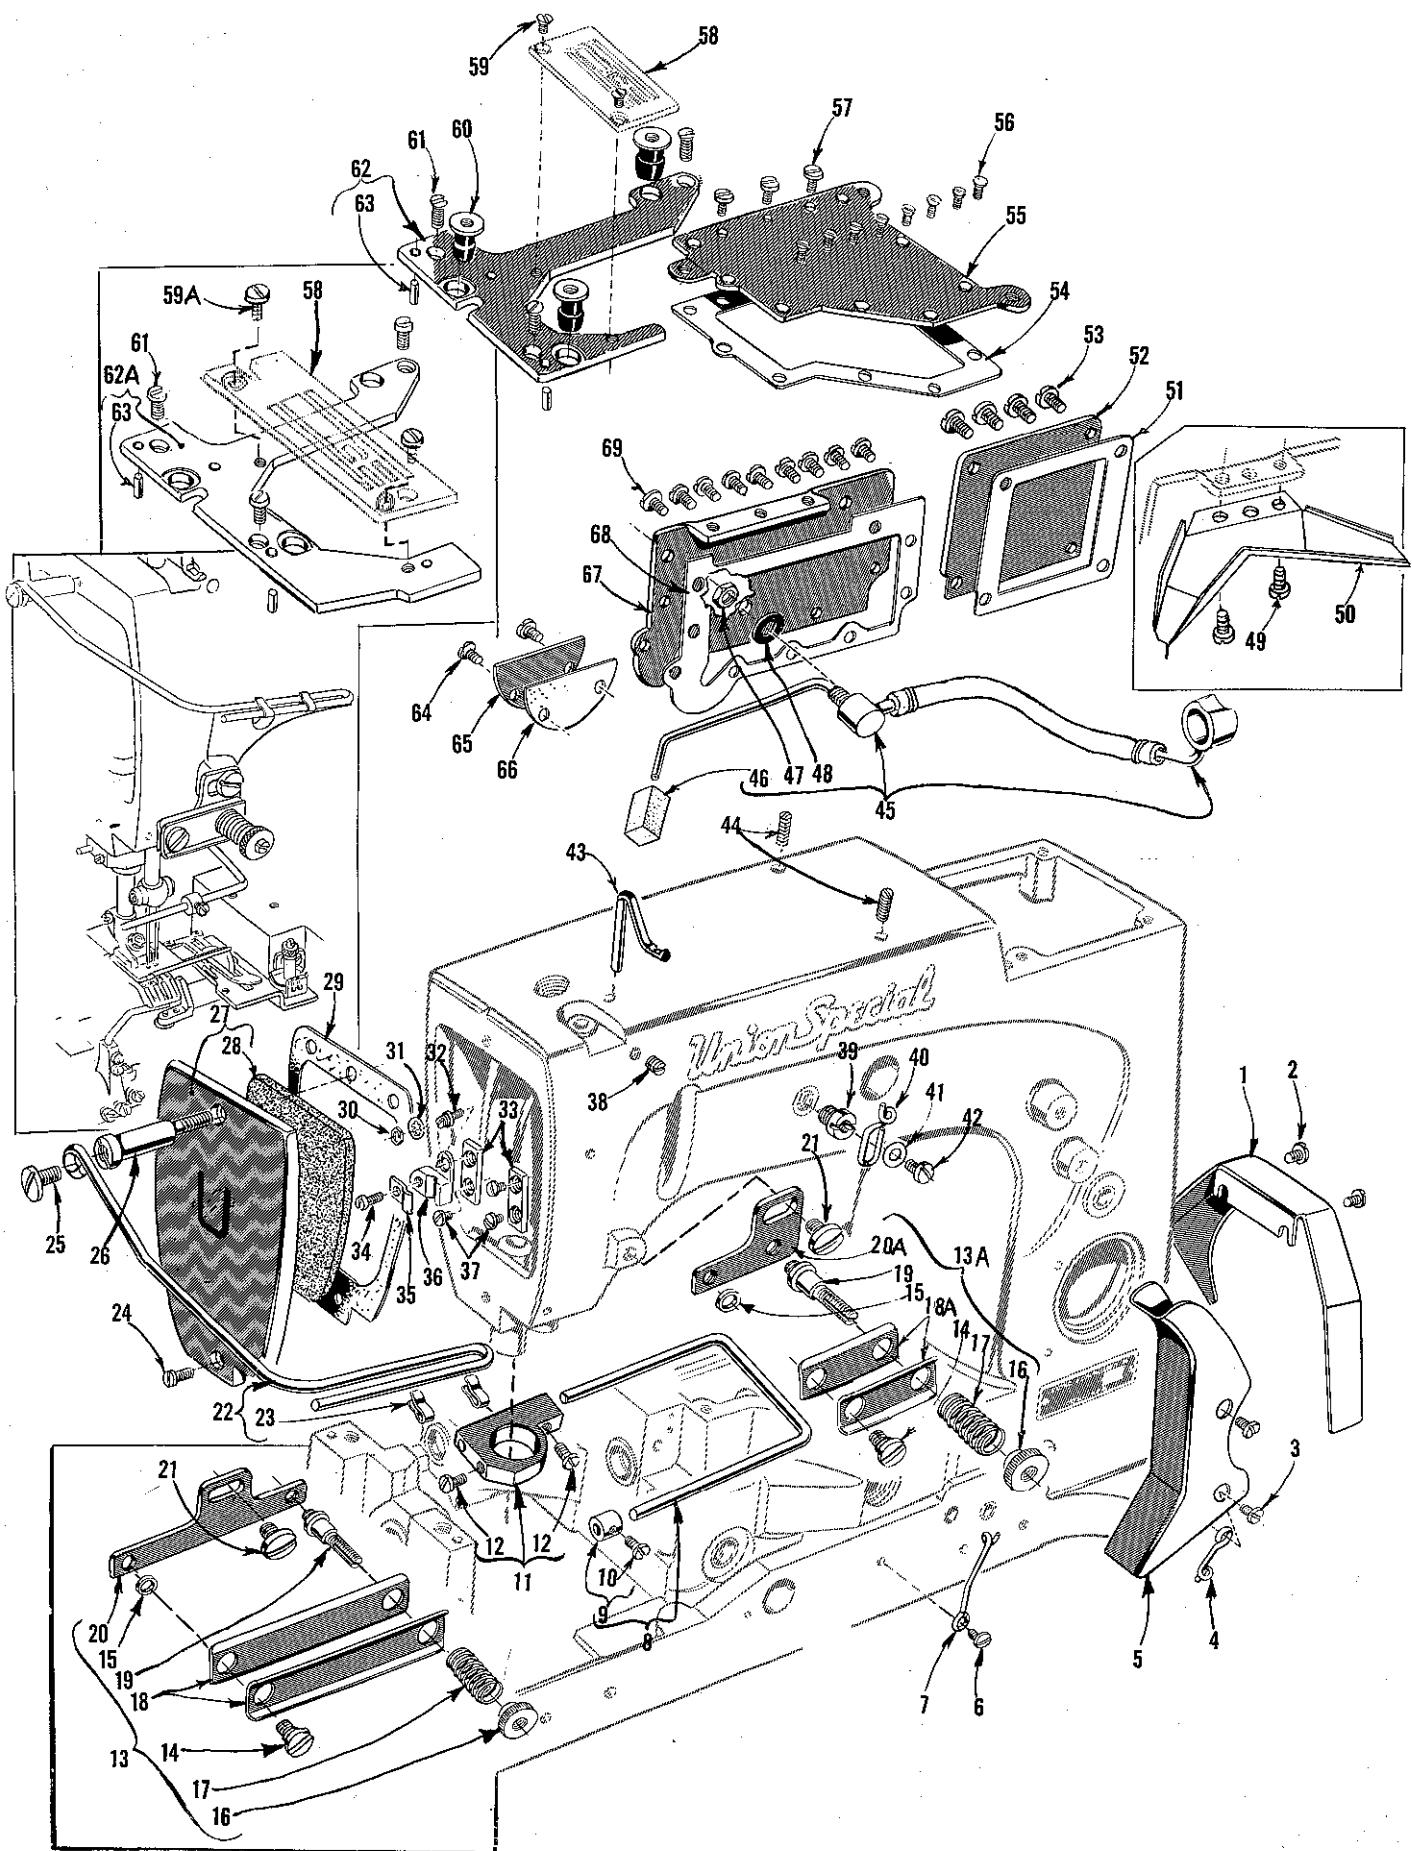

SKIPPED STITCHES

Condition	Causes	Cures
Right needle loop too small	Take-up wire set too low	Raise take-up wire slightly
	Needle thread pinched by rear needle guard, and collapsing needle loop	Lower rear needle guard slightly
Left needle loop too small	Needle thread pinched by front needle guard, and loop pulled back thru needle	Lower front needle guard slightly
All needle loops too small	Needle thread creased because it is too tight and needle is hot	Use oversize ball eye needle, lower needle frame eyelet, reduce tension
	Needle thread stretched at bottom of stroke, loop not formed till stretch relieved	Lower needle frame eyelet &/or reduce needle thread tension
	Thread sticking in needle grooves, due to heat	Use oversize ball eye needle to reduce friction
	Length of needle eye too long causing delay in needle loop formation	Use needle with shorter eye, drop needle bar slightly or increase looper gauge $1/64$ to $1/32$ inch
	Needle does not rise enough to form needle loop properly	Drop needle bar slightly or increase looper gauge $1/64$ to $1/32$ inch
Thread twisting around right needle	Large needle loop, or wrong twist thread	Lower take-up slightly, or increase thread tension. Use a left twist thread
Thread twisting around left needle	Front needle guard pinching needle thread pushing thread thru needle eye, or wrong twist thread	Lower front needle guard slightly, or increase thread tension. Use a left twist thread
Looper misses left needle loop	Left needle not being pushed by front needle guard	Push left needle with front needle guard toward the path of the looper
Looper misses both needle loops as presser foot is coming off a seam	Material is not held down in front of seam and is flagging	See if presser bar is sticking
Looper misses right needle loop as presser foot is coming off a seam	Needle deflecting toward operator	Check needle for burrs. Use sharp point needles.
Looper misses right needle loop when operator is trying to match seams or ends of garments	Needle deflected toward operator who may be holding back on material while matching seams or ends of garment.	Do not hold back excessively on material. Properly adjust feed and maintain a light presser foot pressure so operator does not hold back.
Machine misses right needle loop when stitch length is increased	Needle deflecting toward operator because the rear needle guard is set too far forward	Move rear needle guard to the rear
Both needle loops formed properly but brushed out of the way of looper	Needle bar set too high	Lower needle bar slightly
Needles miss triangle on looper thread side	Looper thread too loose, and not making a good triangle	Increase looper thread tension
	Needle being deflected to the rear by burr on needle point or due to operator pulling on material, or needle glancing off when coming on a seam	Do not pull material at the back. Use a sharp needle to stop needle from glancing off seam. Check needle for burr.
