# 1. PRECAUTIONS BEFORE STARTING OPERATION

## 1) Safety precautions

- (1) When turning the power on, keep your hands and fingers away from the area around/under the needle and the area around the pulley.
- (2) Power must be turned off when the machine is not used, or when the operator leaves his/her seat.
- (3) The power must be turned off before tilting the machine head, installing or removing the “V” belt, adjusting the machine, or when replacing.
- (4) Avoid placing fingers, hairs bars etc., nears the pulley, “V” belt, bobbin winder pulley, or motor when the machine is operation. Injury could result.
- (5) Do not insert fingers into the thread take-up cover, under/round the needle, or pulley when the machine is in operation.
- (6) If a belt cover, finger guard, and/or eye guard are installed, do not operate the machine without these safety devices.

## 2) Precaution before starting operation

- (1) If the machine's oil pan has an oil sump, never operate the machine before filling it.
- (2) If the machine is lubricated by a drop oiler, never operate the machine before lubricating.
- (3) When a new sewing machine is first turned on, verify the rotational direction of the pulley with the power on.  
(The pulley should rotate counterclockwise when viewed from the pulley.)
- (4) Verify the voltage and (single or three) phase with those given on the machine nameplate.

## 3) Precaution for operating conditions

- (1) Avoid using the machine at abnormally high temperature (35°C or higher) or low temperatures (5°C or lower). Otherwise, machine failure may result.
- (2) Avoid using the machine in dusty conditions.
- (3) Avoid using the machine in areas where too much electrical noise, resulted from the high-frequency welder and others, is generated.

## 2. SPECIFICATIONS

SPECIFICATION		MODEL	
		GC0918-1-D	GC0918-1
Sewing Speed	(Stitch length, 4mm or more)	3500spm	
	(Stitch length, less than 4mm)	4000spm	
Max. Feeding length	Drop feeding (mm)	5	
	Top feeding (mm)	8 (Reverse 3)	
Needle bar stroke (mm)		31.8	
Applicable Needle Type		DB × 1 (Organ needles are standard)	
Thread Take-up Lever Stroke (mm)		58	
Presser Foot Lift	Hand lifter (mm)	4	
	Knee lifter (mm)	12	
Rotating Hook		Auto lubricated hook for trimmer	Auto lubricated hook
Lubrication		Auto lubricated	
Motor		Speed adj. motor	370W Clutch motor

**CAUTION:** Some materials and/or sewing conditions may require specifications other than those listed above.

## 3. PREPARATION BEFORE STARTING OPERATION

### 1) Adjustment of needle stop position

#### (1) Adjustment of "UP" stop position

The machine will stop at the "UP" stop position, after the thread trimming has been completed by heeling the pedal. If the timing marks are off more than 3 mm from the "UP" position, adjust as follows:

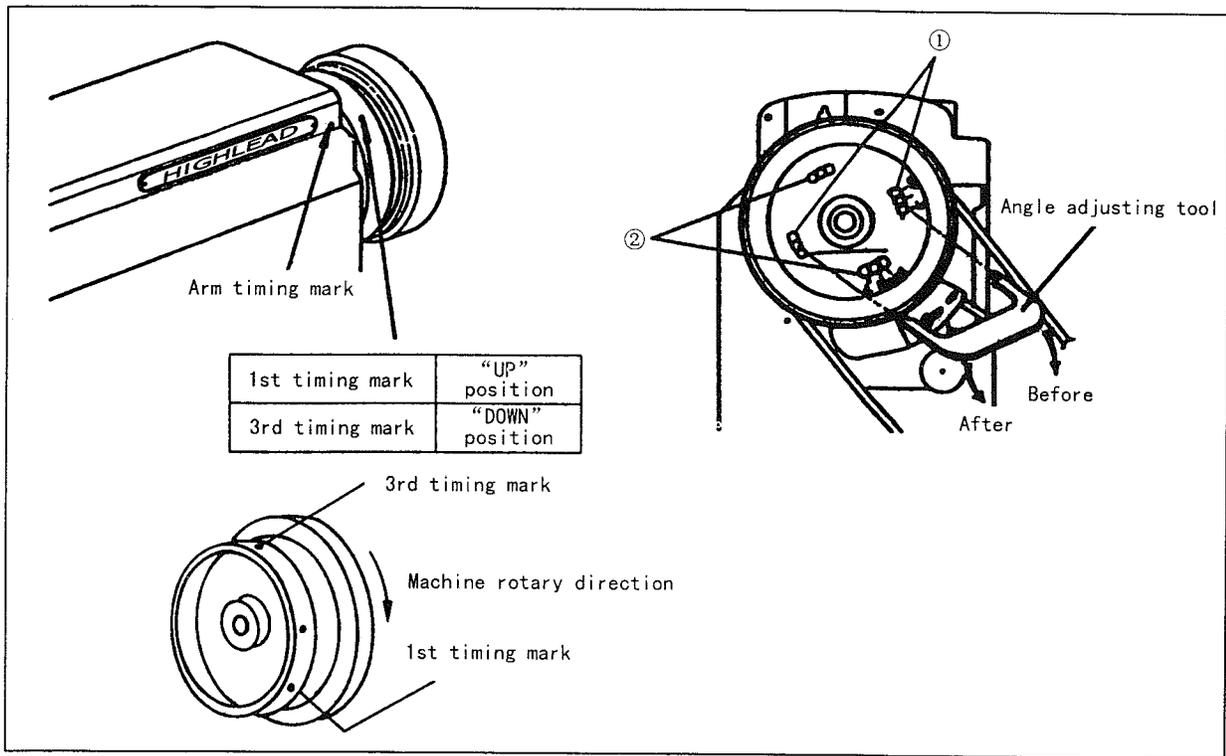

- a. Disconnect the plug (including 12 pins) of the wire, extended from the machine head, at the control box.
- b. Operate the machine and, then, stop at the "UP" Stop position by heeling the pedal.
- c. While holding the pulley, insert the angle adjusting tool into two holes ① and, then, rotate the pulley.

#### (2) Adjustment of "Down" stop position

The machine will stop at the "DOWN" stop position, when the pedal is returned to the neutral position. If the timing marks are off more than 3 mm from the "DOWN" position, adjust as follows:

- a. Disconnect the plug (including 12 pins) of the wire, extended from the machine head, at the control box.
- b. Operate the machine and, then, stop at the "DOWN" Stop position by setting the pedal at neutral position.
- c. While holding the pulley, insert the angle adjusting tool into two holes ② and, then, rotate the pulley.

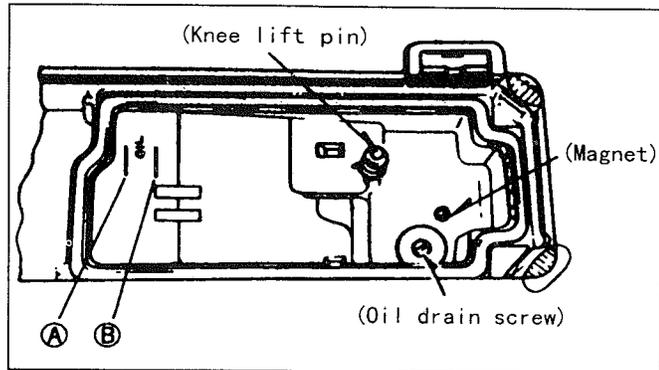

#### (3) Connect the plug (including 12 pins) of the wire, extended from the machine head, to the receptacle of the control box, after confirmed the stable stop position.

#### 4. PRECAUTIONS FOR STARTING OPERATION

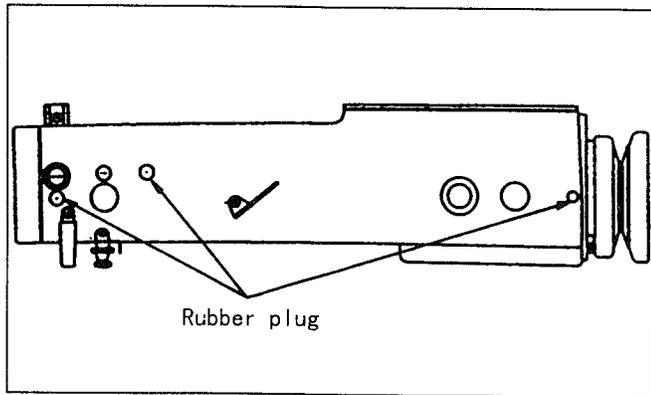

##### 1) Lubrication (1)

Fill the oil tank up to **(A)** line.  
 Check the oil level periodically during operation,  
 and replenish the oil up to A line whenever the oil  
 level is below **(B)** line.

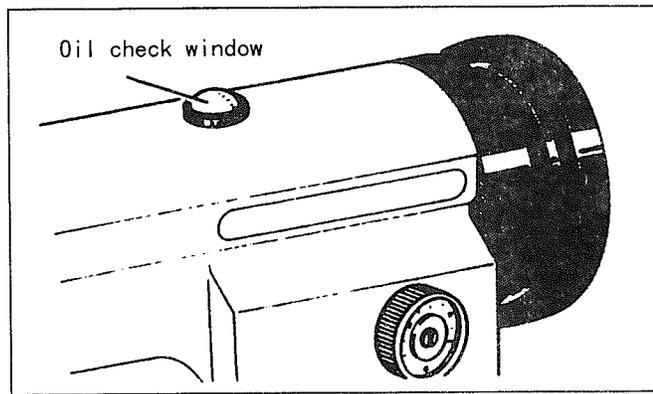

##### 2) Lubrication (2)

Remove the rubber plug indicated by the arrow  
 mark, from the machine and lubricate sufficiently,  
 when beginning to operate a new machine or a used  
 machine which has been stored a long time.

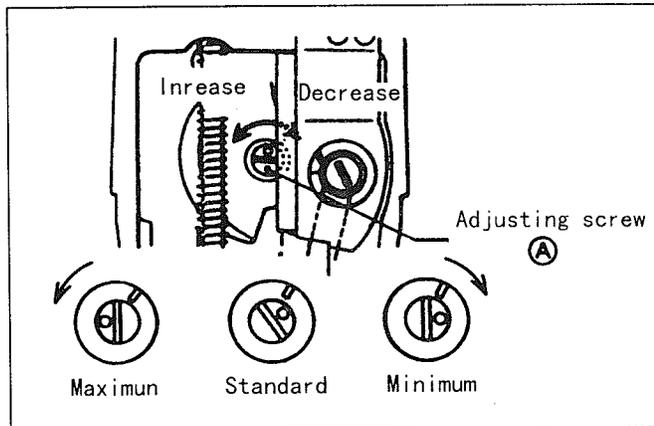

### 3) Condition of lubrication

Verify the oil splashing through the oil check window, while operating the machine.

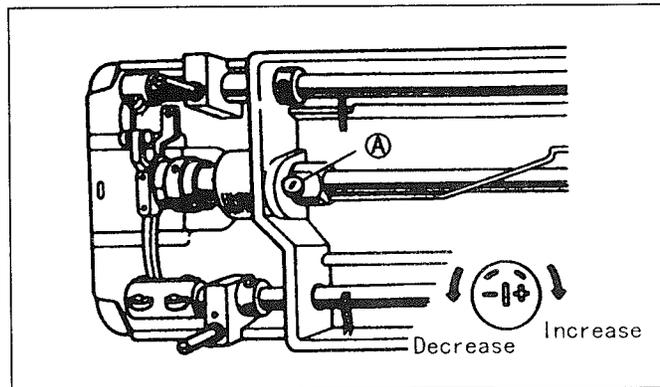

### 4) Lubrication adjustment for upper shaft

Remove the face plate, and adjust the lubricant quantity by turning the upper shaft lubricant adjusting screw (A).

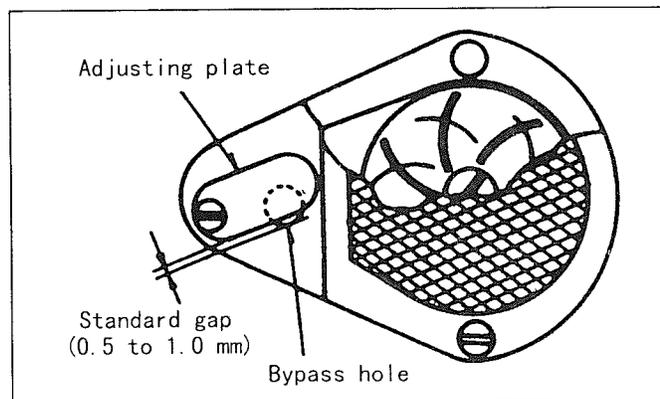

### 5) Lubrication adjustment for rotating hook

Adjustment is made by the screw (A).

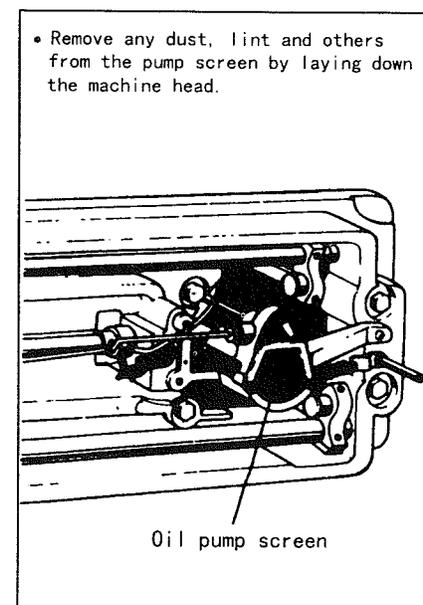

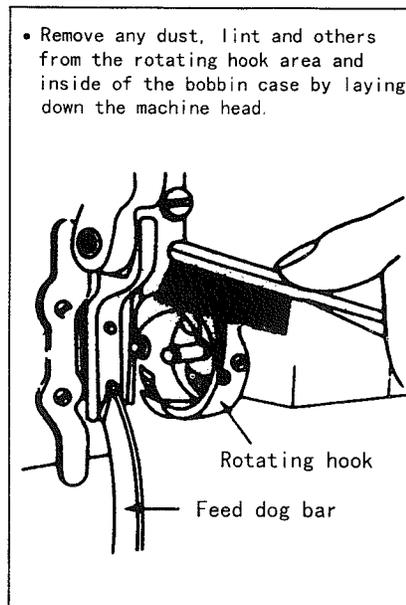

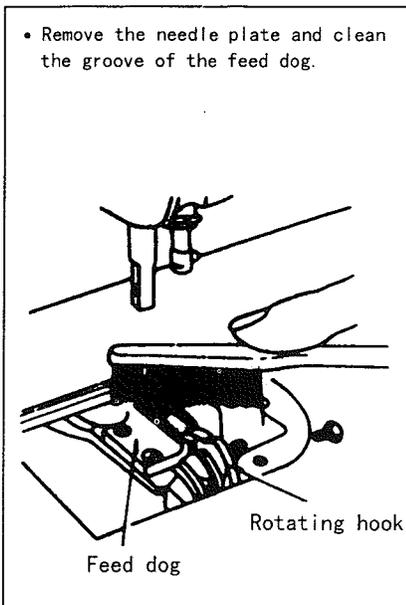

### 6) Lubrication adjustment for oil pump

The standard adjustment is as follows:  
Close the gap in the bypass hole in case of no oil splashing found through the arm oil check window under operating the machine at low speed.

## 7) Periodic cleaning (for machine)

(Maintenance for motor)

Remove dust from the motor filter every one or two months. (continued operation with the filter clogged by lint or dust may cause possible overheat of the motor and the running life may be affected improperly.)

(Maintenance for control box)

Remove any dust from the connectors. (The dusty connectors may cause the machine malfunction.)

## 8) Precaution for position detector

If the connector of the needle position detector has been disconnected, the belt has been come off, or the machine has locked completely, the motor will be automatically turned off after a predetermined period of time preventing the motor from burning. (The motor may not be, however, turned off in case of incomplete locking or overloading.) The operation will be restored to normal by turning the power switch off one time and, then, turning it on again, after the failure has been remedied. The activation in case of the failure or short circuit in the detector is, also, as same as above.

## 9) Belt cover installation

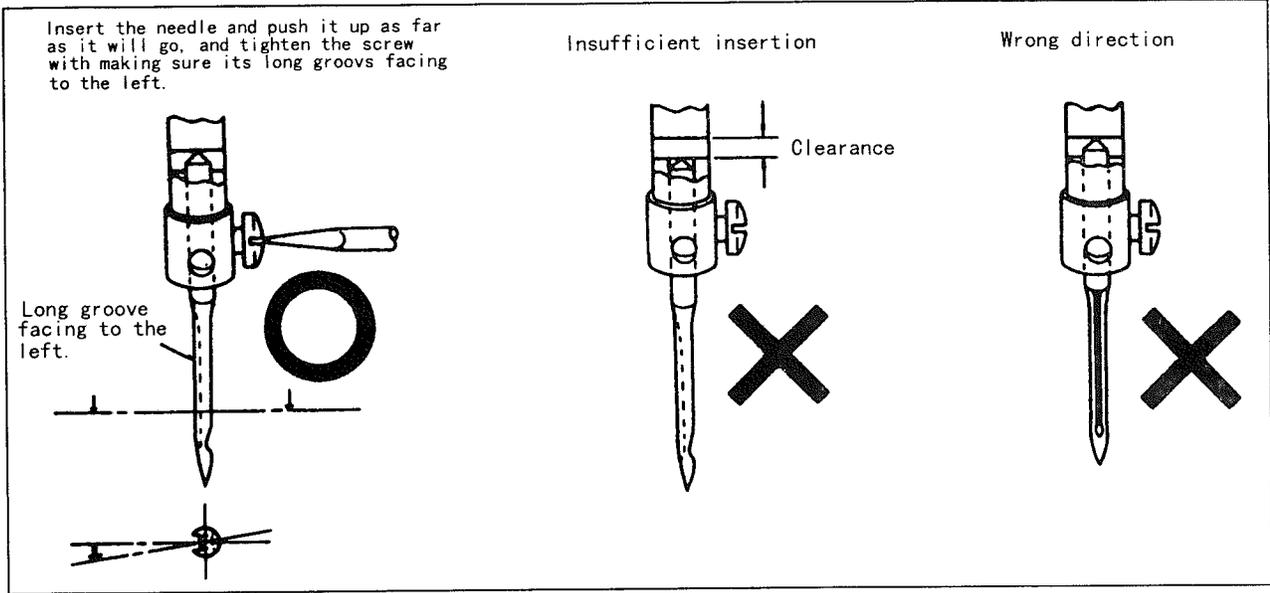

(Machine side) Install the belt cover for safety. Refer to the instruction manual provided in the accessory box.

(Motor side) Install the belt cover for safety.

## 5. HOW TO ADJUST AND USE THE MACHINE

### 1) Needle installation

**Caution: Turn the power switch off before performing the needle**

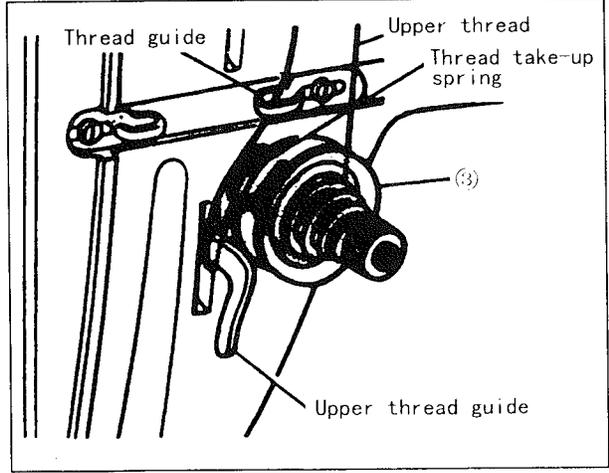

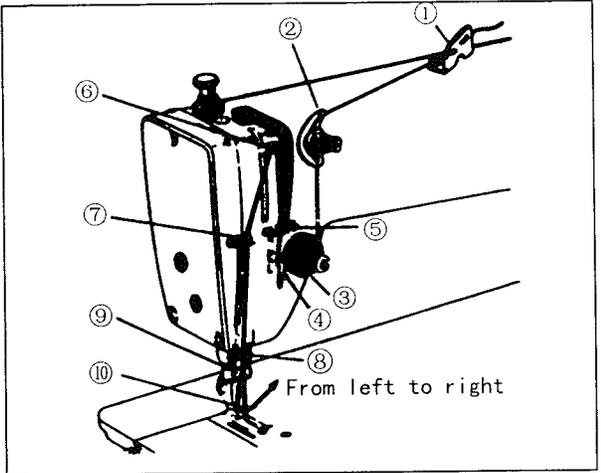

**Note: If thread breaking happens during reverse sewing with polyester threads used, this breaking may be sometime avoided by attaching the needle with the long groove shifted a little to the front side.**

The needle, DB×1 should be used. Choose the needle number in accordance with thread and materials, referring to the following table:

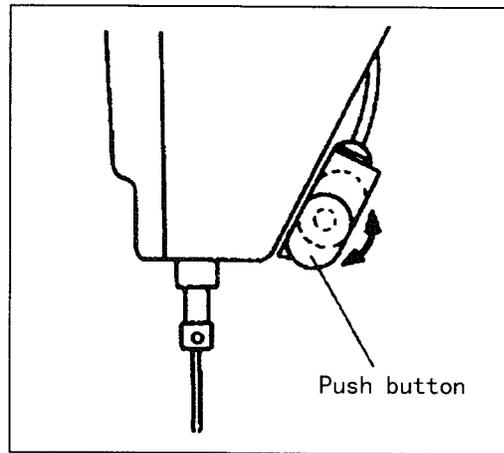

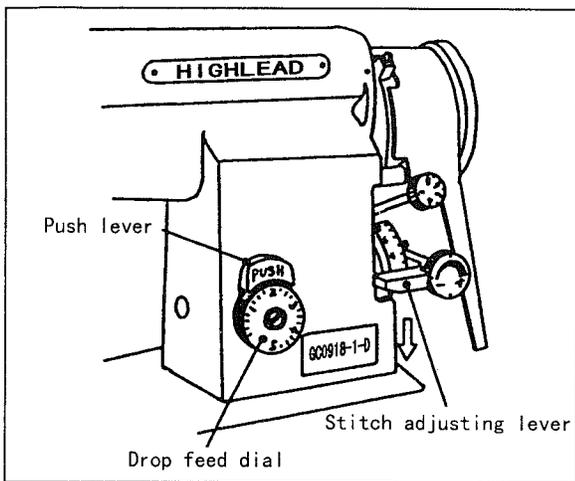

Needle number	Thread size	Materials
#9	#100 to #80	Very thin material such as georgette, organdy and others.
#11	#80 to #60	Thin material such as silk, calico, poplin and others.
#14	#60 to #50	Common material such as cotton, wool and others.
#16	#50 to #30	Thick material such as calico, wool and others, waterproof cloth, thin leather, and others.

## 2) Threading of upper thread

Set the thread take-up lever to its most highest position, and route the upper thread in order of No. as shown in the figure.

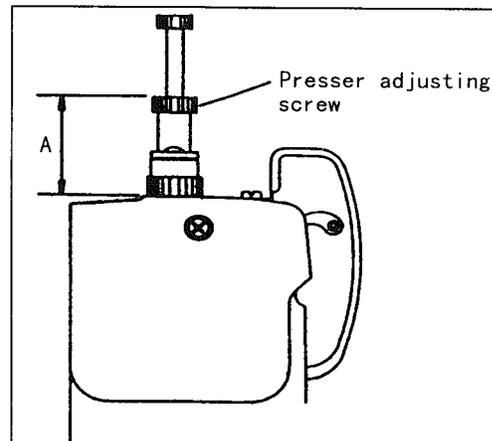

### 3) Stitch length adjustment and reverse sewing

- (1) Rotate the drop feed dial while pressing the push lever, when changing the stitch length.
- (2) Rotate the drop feed dial while depressing the stitch adjusting lever and, then, pressing the push lever, when making the stitch length shorter.
- (3) The reverse sewing can be performed by depressing the stitch adjusting lever.
- (4) The reverse sewing can be performed, also, by pressing the push button of the touch switch.

### 4) Presser adjustment of presser foot

- (1) Adjust the presser to the presser foot in accordance with the sewing materials to be sewn.
- (2) The height (A) of the presser adjusting screw is approx. 40 mm as standard.
- (3) The presser to the presser foot should be adjusted to the minimum required strength.

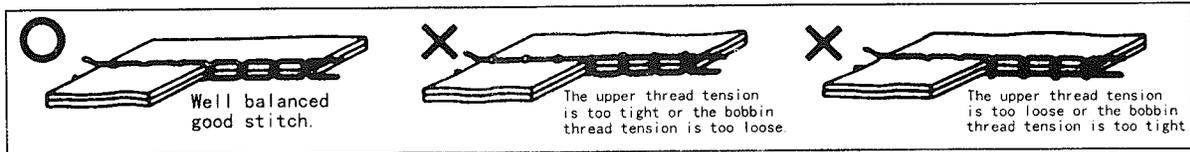

### 5) Adjustment of thread guide

Adjust the thread guide in accordance with the sewing condition for the materials to be sewn and thread.

	1	2	3
Thread guide position	Left side 	Center 	Right side 
Material to be sewn	Heavy	Medium	Light
Thread (reference)	Polyester Cotton Vinylon #30 or more	Polyester #50 or 60 Cotton Vinylon #50 or 80	Polyester #50 or 80

## 6) Stitch conditions

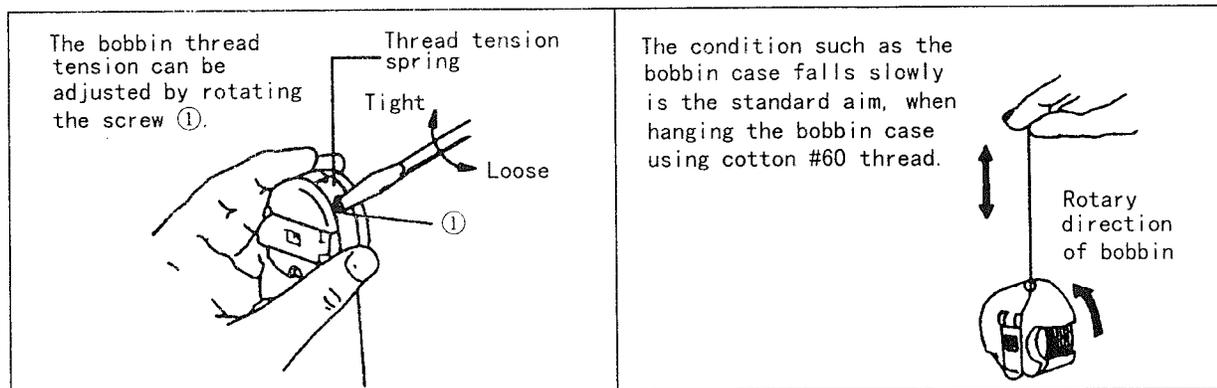

## 7) Upper thread tension

- (1) The upper thread tension can be adjusted by rotating the thread tension nut.
- (2) The upper thread tension should be adjusted, based upon the bobbin thread tension.  
In addition, the upper thread tension is adjusted in accordance with the strength and operating range of the thread take-up spring, for special fabric sewing with special material and thread.

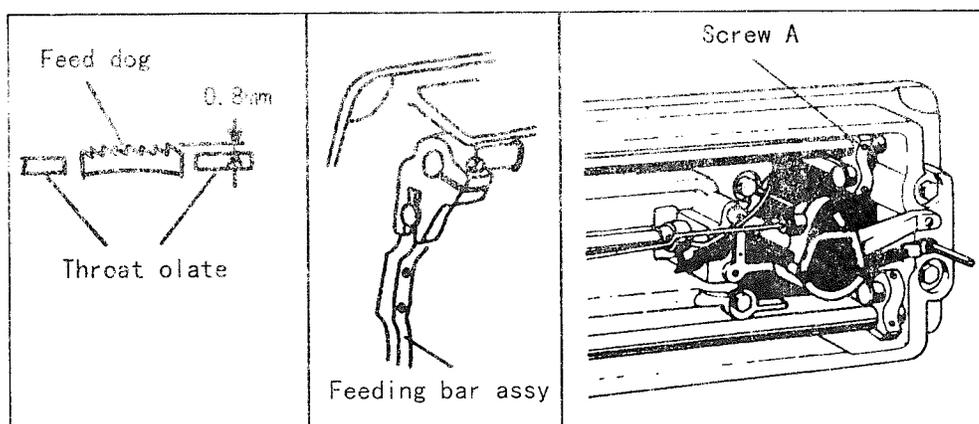

## 8) Bobbin thread tension

## 9) Feed dog height

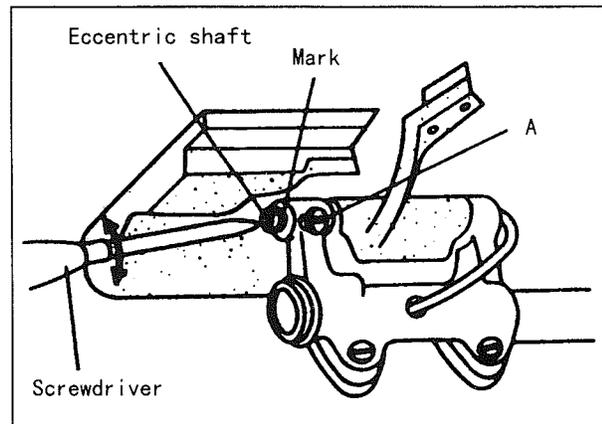

- (1) The protrusion, such as the feed dog is 0.8 mm higher than the throat plate, is the standard aim.
- (2) Adjust the feed dog height as follows:
  - a. Perform the adjustment by loosening the set screw A in the feed lifting prong and, then, moving the feeding bar assy. up and down.
  - b. The setscrew A should be securely tightened after adjustment.

## 10) Adjustment of feed dog inclination

The feed dog has been set to the standard (horizontal level). Adjust the inclination in accordance with the sewing conditions, if necessary, as follows:

- (1) Loosen slightly the screw A located at left side top of the feeding rock shaft crank..
- (2) Rotate the eccentric shaft clockwise (to lift the front end), or counterclockwise (to lower the rear end), while pressing the groove in the eccentric shaft by using a screwdriver.
- (3) The screw A should be tightened after adjustment.

Eccentric shaft	Mark position	Feed dog	
	Horizontal		Standard (See note)
	Up		Front up
	Down		Front down (See note)

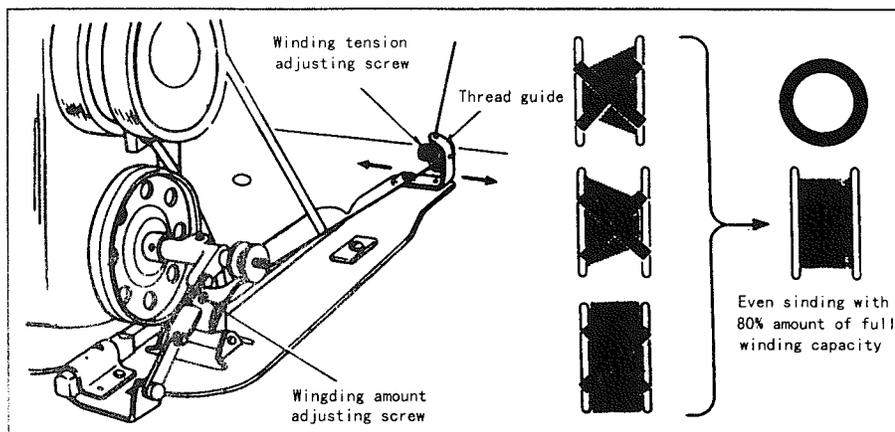

- It may be possible to have an effect on prevention of the pucker by lifting the front end of the feed dog.
- It may be possible to have an effect on prevention of the cloth shifting by lowering the front end of the feed dog.

**Note:** This table shows the conditions such as the feeding dog protrudes 0.8mm from the throat plate.

**Caution:** It is required to readjust the feed dog height in accordance with Para.9) Feed dog height, because the height will be change by adjusting the fed dog inclination.

## 11) Winding for bobbin thread

- Adjustment
- Strength of thread winding: Wind the thread loosely, particularly in case of polyester or nylon thread.
  - Uneven thread winding: Slide the thread guide toward the less wound portion of the bobbin, if the thread is wound un evenly.
  - Winding Amount: Loosen the adjusting screw when the bobbin winding amount is excessive, and tighten the adjusting screw when the winding amount is insufficient.

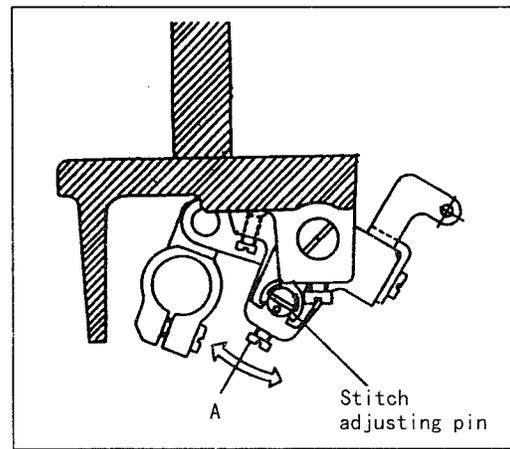

**Caution:** The presser foot should be lifted up, when running idle.

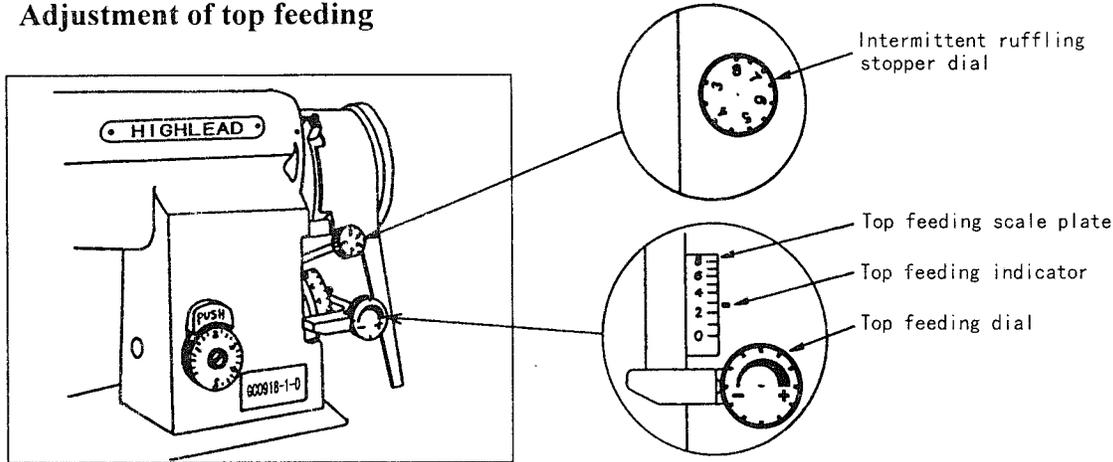

## 12) Adjustment of stitch length for forward/reverse sewing

- (1) Tilt the machine.

- (2) Depress the stitch adjusting lever and swing the Screw A to the position easy to access.
- (3) Adjust the stitch length by rotating the stitch adjusting pin.
  - The stitch length at the forward sewing will increase and the length at the reverse sewing will decrease, when turning the pin clockwise.
  - In opposition, the stitch length at the forward sewing will decrease and the length at the reverse sewing will increase, when turning the pin counterclockwise.
- (4) Tighten the screw A after adjusting.

### 13) Adjustment of top feeding

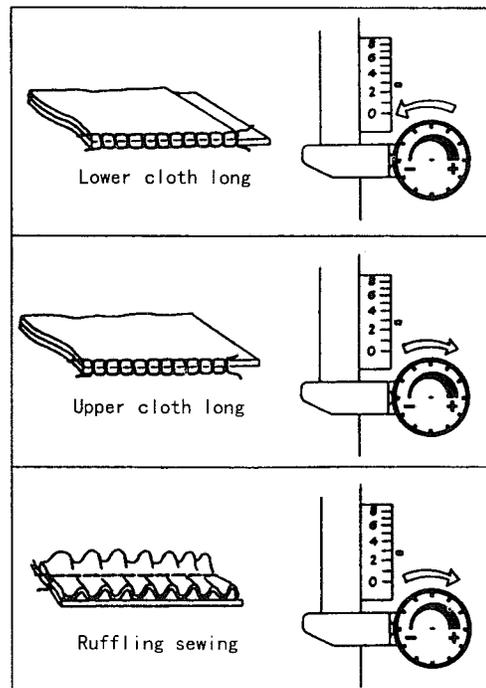

- (1) The top feeding amount will increase when turning the top feeding dial clockwise ((+) side), and decrease when turning counterclockwise ((-) side). It may be possible to make the magnitude of the top feeding amount the standard aim, in accordance with the position of the top feeding indicator on the top feeding scale plate.
- (2) The intermittent ruffling stopper dial, regulates the maximum top feeding amount, when using the intermittent ruffling sewing unit (option).
- (3) Set the intermittent ruffling stopper dial to MAX.(8 mm) in case of no intermittent ruffling sewing unit (option) used.
- (4) Set the intermittent ruffling stopper dial to MAX. as follows:
  - a. Set the top feeding dial to 3 or more.
  - b. Turn the intermittent ruffling stopper dial clockwise fully.
  - c. The position, such as the dial strikes and does not turn any more, is "MAX." position. (The scale "8" comes just above.)
  - d. Reset the top feeding dial to the desired scale.

### 14) Adjustment of sewing shift

- (1) In case of the lower cloth longer at the sewing end:  
Adjust the sewing shift by turning the top feeding dial counterclockwise ((-) side).
- (2) In case of the upper cloth longer at the sewing end:  
Adjust the sewing shift by turning the top feeding dial clockwise ((+) side).

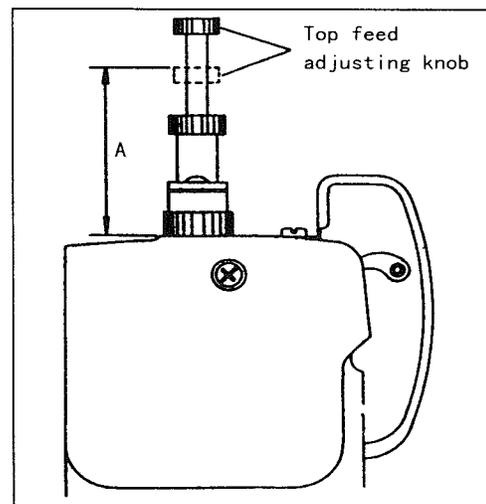

- (3) **Ruffling sewing**  
 Turn the top feeding dial clockwise ((+) side) with using pusher type gauge and separator.  
 The ruffling sewing is possible by increasing the top feeding amount.

**Caution: Operate the machine with speed 3500 rpm or less in case of the top feeding amount 4 mm or more ,or the drop feeding amount 4 mm or more.**

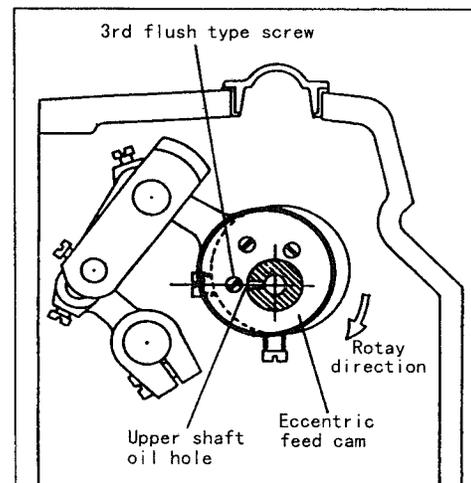

### 15) **Presser adjustment of top feed dog**

- (1) Press down the top feed adjusting knob. The presser to the top feed dog will become stronger when turning . the knob clockwise, and weaker when turning counter-clockwise. (Rotate the top feed presser adjusting knob in such condition as engaged firmly, after depressing downward.)
- (2) The height A is approx. 51 mm as standard, when the top feed adjusting knob is depressed downward, with the presser foot bottom contacted to the throat plate after dropping the presser foot down.
- (3) The stronger the top feed dog pressure becomes, the better the top feed efficiency will become. The weaker the top feed dog pressure becomes, the worse the top feed efficiency will become.
- (4) It should be avoid to make the top feed dog pressure stronger too much, because the cloth may result in slip or damage due to the presser foot lifted up by the top feed dog.

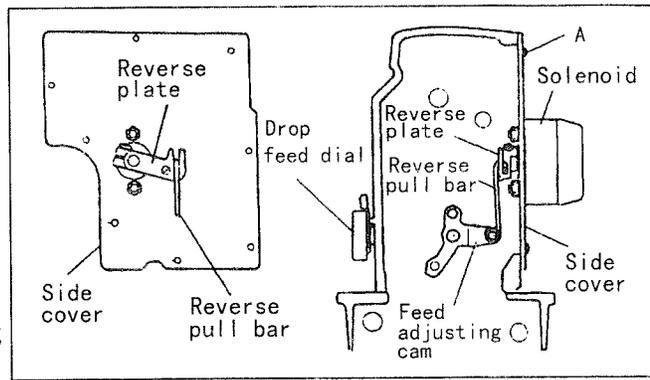

### 16) **Adjustment of feed timing**

- (1) The standard assemble condition for the eccentric cam is that the oil hole for the upper shaft should be aligned with the third flush type screw as shown in the figure.
- (2) The adjustment is to be performed by opening the side cover and by changing the set position of the eccentric feed cam.

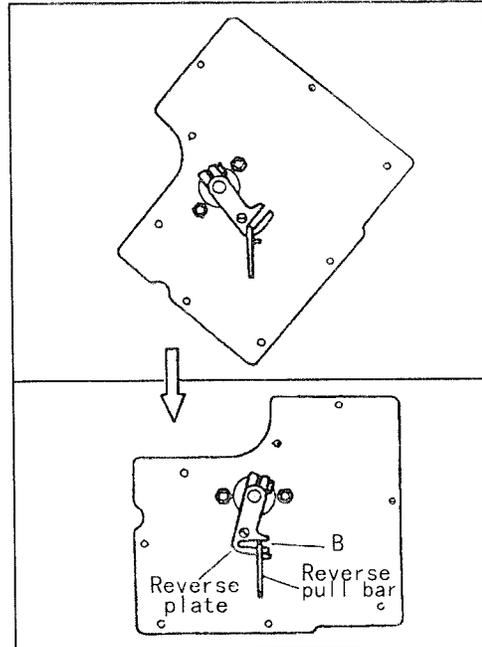

## 17) Side cover removal and installation

A solenoid for automatic reverse sewing is mounted on the side cover. When the reverse sewing solenoid is energized by the signals from the touch switch and others, the reverse plate will sway. This will cause the reverse plate to pull up the reverse pull bar, and to rotate the feed adjusting cam to the position which will initiate the reverse sewing, and the reverse sewing will be conducted.

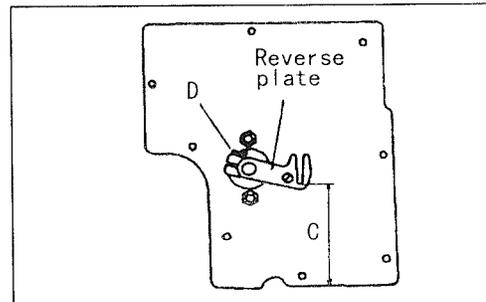

### (1) Side cover removal

- a. Set the stitch adjusting dial to "zero".
- b. Remove the mounting screws A (8 pieces).
- c. Rotate the side cover so that the groove B of the reverse plate is in horizon, as shown in the figure on the left side.
- d. Remove the reverse pull bar from the groove B of the reverse plate.

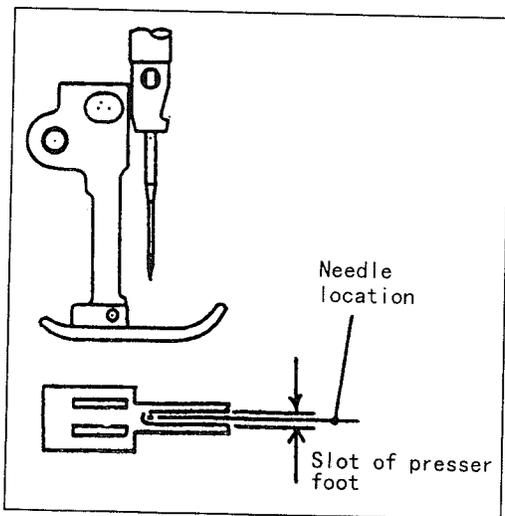

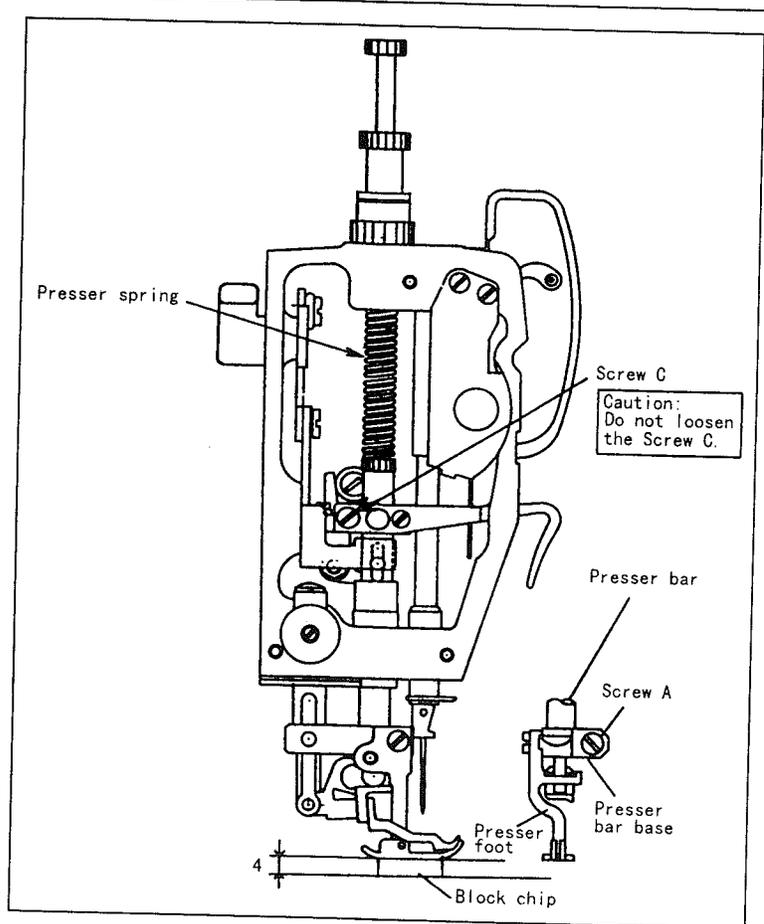

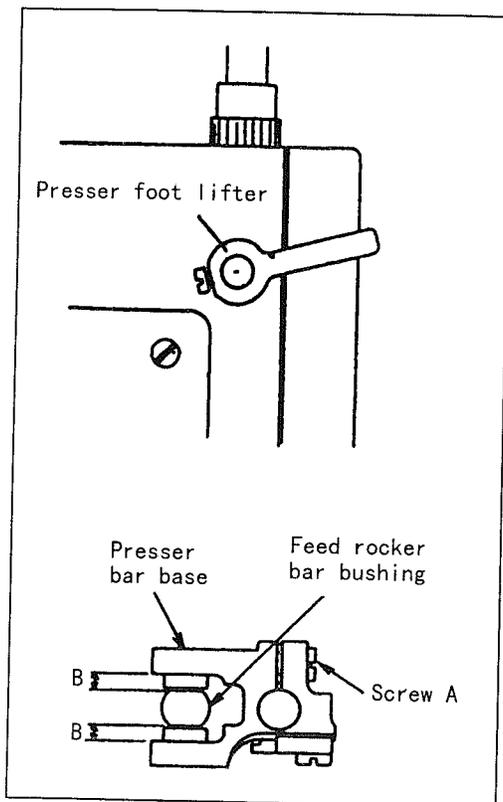

### (2) Install the side cover in reverse order as described above.

Adjust the set position of the reverse plate, related to the automatic reverse sewing, so that the distance C will be 76.5 mm, by using the bolt D.

## 18) Position adjustment for presser bar base

- (1) Set the feed dog position lower than the needle plate surface.
- (2) Raise the presser foot lifter.
- (3) Insert the 4 mm block chip between the presser foot and the needle plate.
- (4) Fasten the screw A of the presser bar base so that the bottom of the presser foot touch the 4 mm block chip.
- (5) When fasten the screw A of the presser bar base, adjust the clearance B between the feed rocker bar bushing and the presser bar base evenly and set the presser foot in proper condition that the needle position is on the center line of the slot of the presser foot.

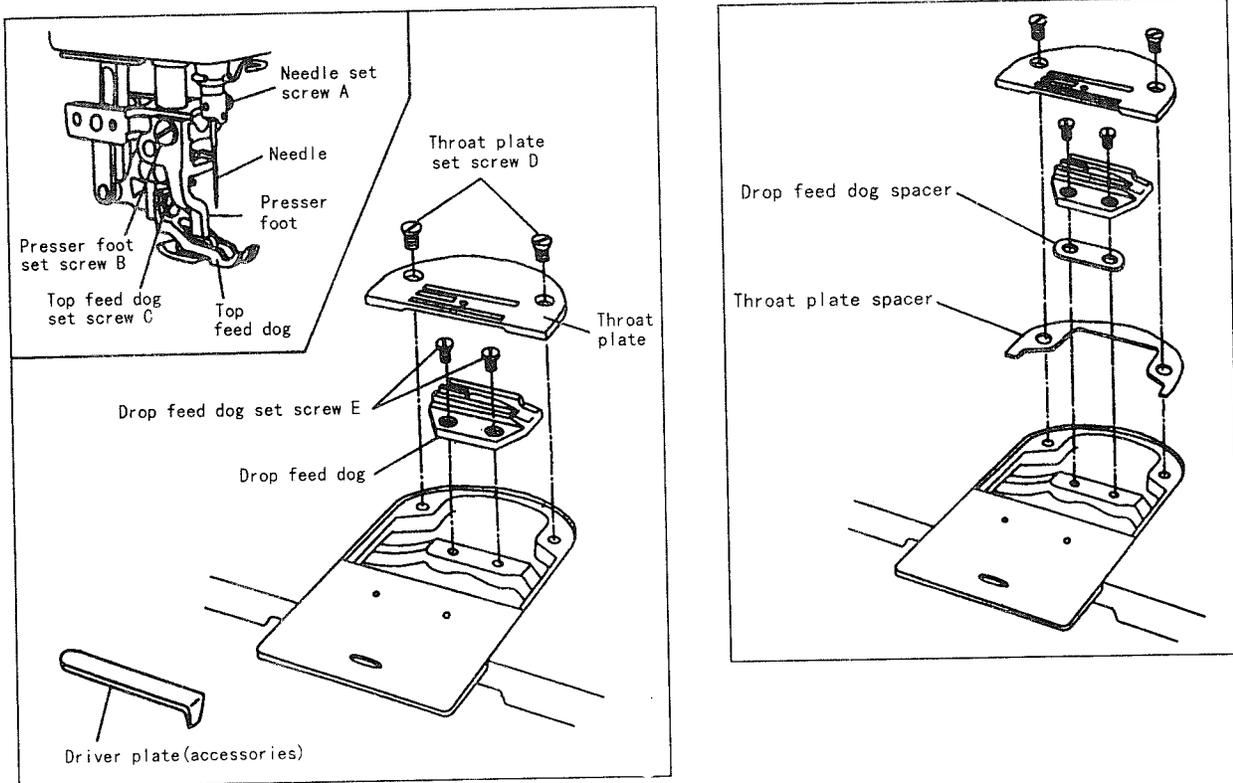

- (6) Make sure the presser bar base can be moved up and down smoothly by removing the presser spring.  
If it can not move smoothly, adjust again with same procedures mentioned above.
- (7) Set back the presser spring.

## 19) Gauge parts replacement

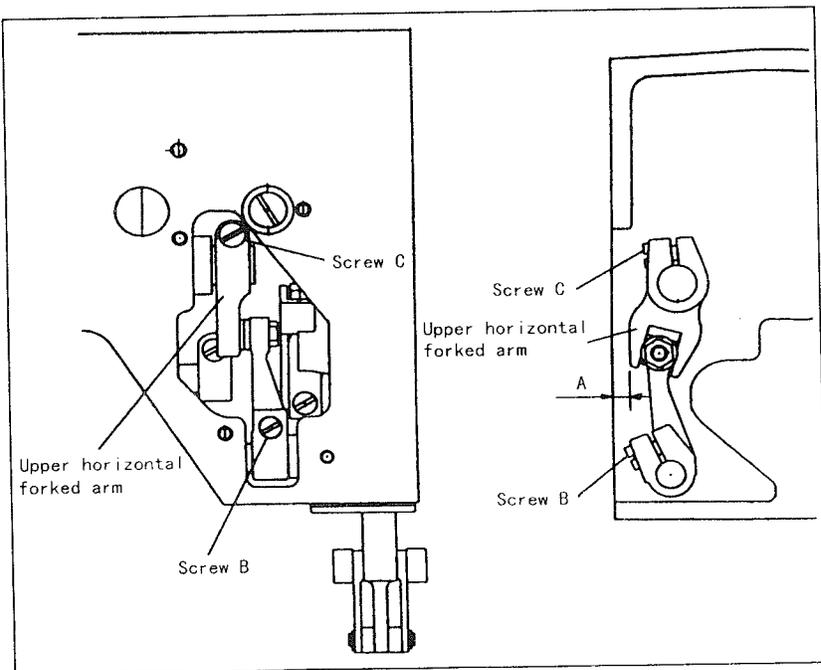

- (1) Gauge removal
  - a. Remove the needle by loosening the needle set screw A.
  - b. Remove the presser foot by loosening the presser foot set screw B. (It is very easy to remove the presser foot by raising the Top feed dog up.)
  - c. Remove the Top feed dog by removing the Top feed dog set screw C.
  - d. Remove the throat plate by removing the throat plate set screw D. (It is very easy to loosen or tighten the throat plate set screw D by using the driver plate included in the accessories.)
  - e. Remove the Drop feed dog by removing the Drop feed dog retaining screw E.
- (2) Gauge installation
  - a. The installation should be conducted in the reverse order of the gauge removal.

- b. Confirm the height of the Drop feed dog after installation.
- (3) Commercial gauge installation
- a. Install the commercial gauge by inserting each spacer (included in the accessories) underneath the feed dog and the throat plate.

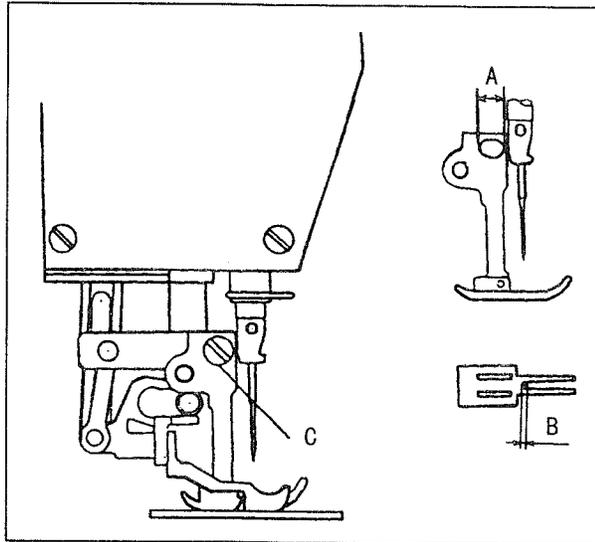

## 20) Adjustment of upper horizontal forked arm

- (1) Set the drop feed dial to "3", and the intermittent ruffling stopper dial and the Top feeding dial to MAX. (8), respectively.
- (2) The clearance A between the upper horizontal forked arm and the arm (the side cover attaching surface) is to be adjusted to approx. 5.5 mm, when the lower end of the upper horizontal forked arm comes nearest to the left side.
- (3) The adjustment should be conducted at the setscrew C by loosening the screw B.
- (4) Tighten the screw B and screw C securely after adjusting.

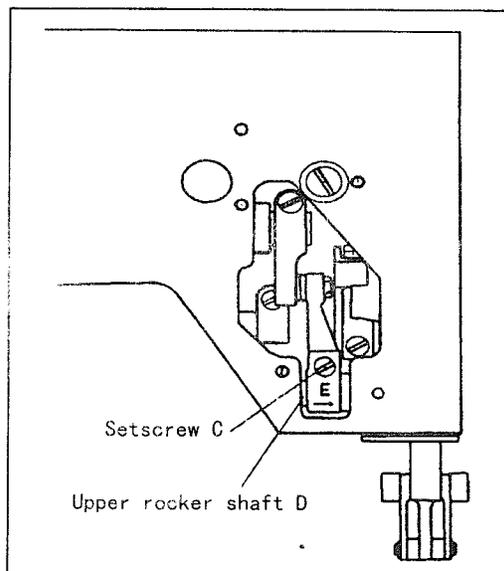

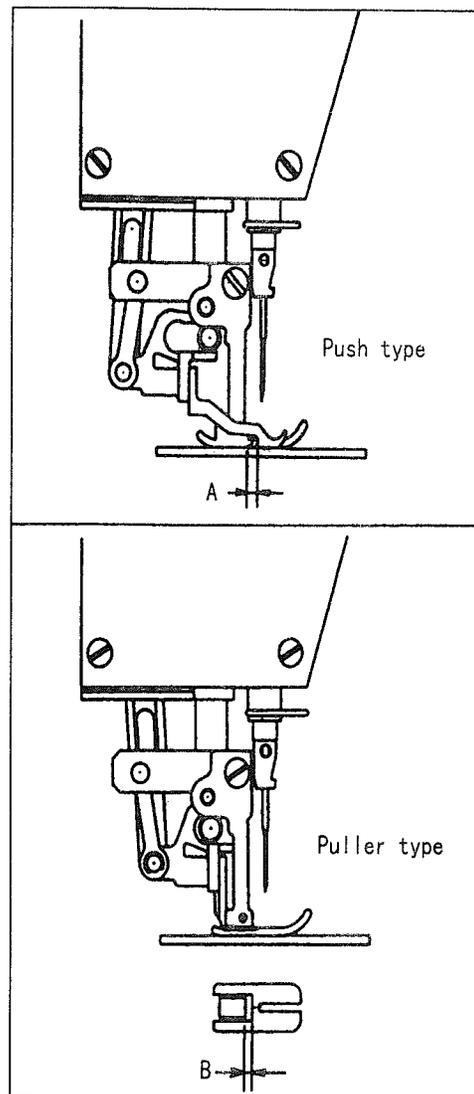

## 21) Adjustment of front back positions for presser foot

- (1) the attaching hole A is a elongated hole.
- (2) The distance B between the presser foot long groove and the needle drop center is to be adjusted to approx. 1 mm , when installing the presser foot by using the screw C.

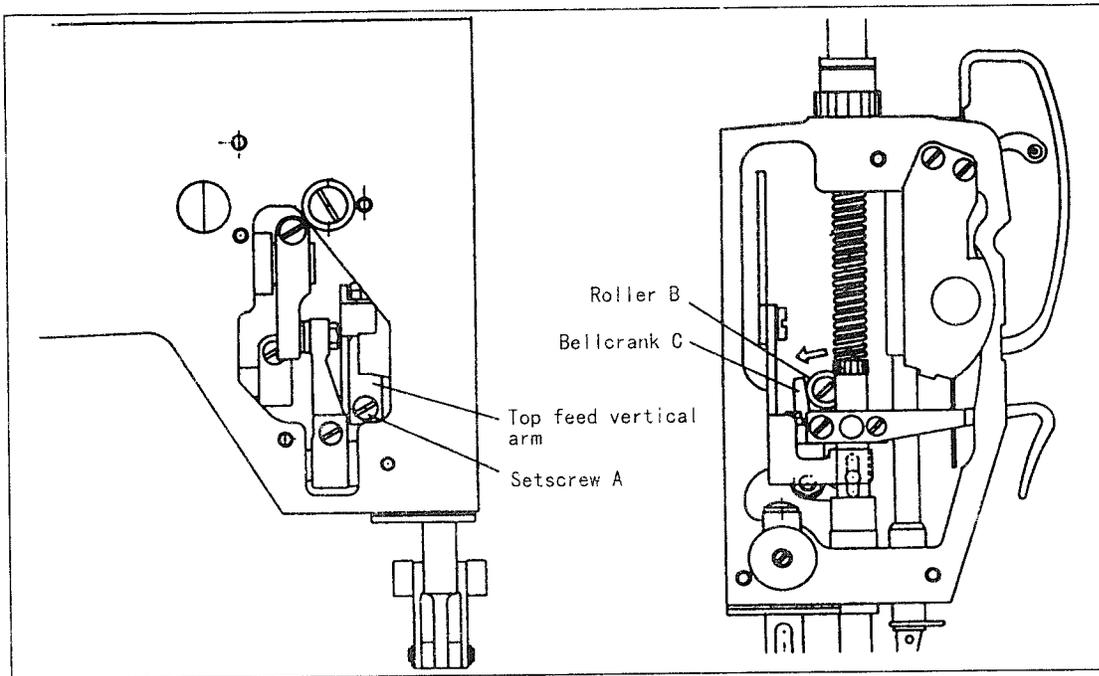

## 22) Adjustment of clearance between top feed dog and presser foot

- (1) Set the top feeding amount to MAX.(8 mm) position.
- (2) Rotate the pulley, until the clearance A (the clearance between the top feed dog and the presser foot, when the top feed dog comes nearest to the left side, in case of the pusher type gauge) or the clearance B (the clearance between the top feed dog and the presser foot, when the top feed dog comes nearest to the right side, in case of the puller type gauge) will become the minimum.
- (3) Remove the side cover from the back side of the arm.
- (4) Loosen the setscrew C on the upper horizontal arm.
- (5) Move the top feed dog, so that the dimension A (in case of the pusher type gauge) or the dimension B (in case of the puller type gauge) becomes 1.0 mm.
- (6) Tighten the setscrew C on the upper horizontal arm.

**Caution:** It is recommended to tighten the setscrew C, while pushing the upper horizontal arm lightly to the direction of the arrow mark E so that no play occurs on the upper rocker shaft D to in the direction of the thrust.

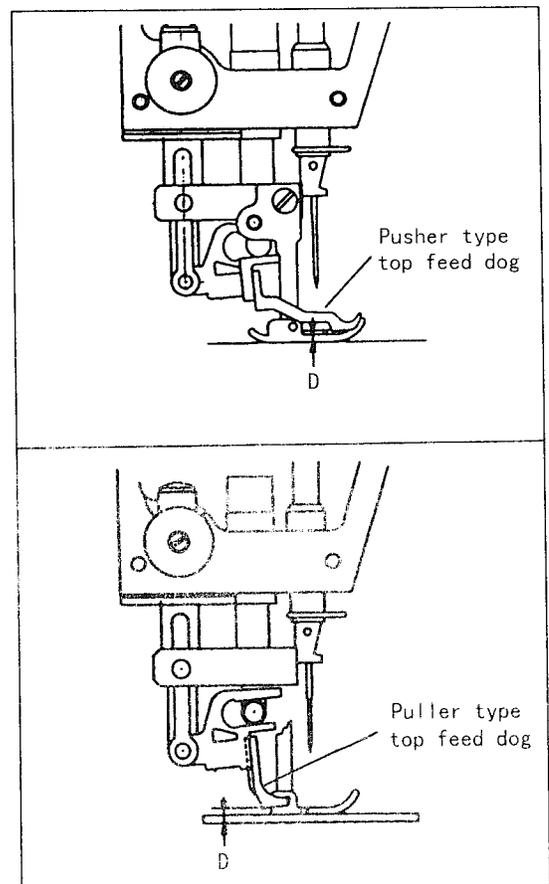

### 23) Adjustment of vertical motion for top feed dog

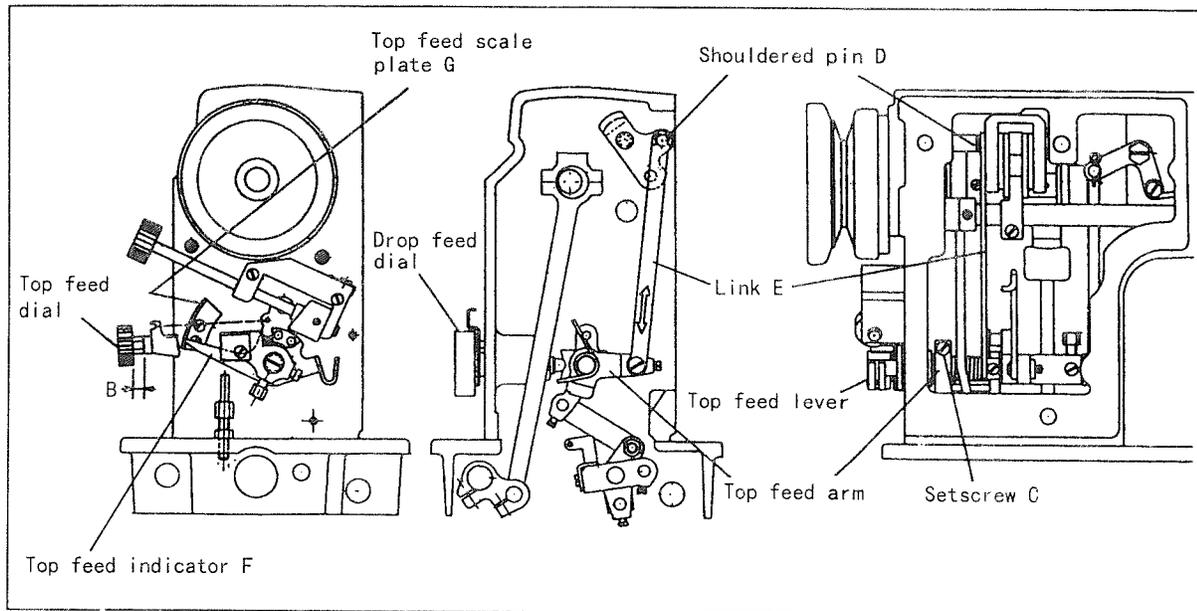

- (1) Remove the side cover from the back side of the arm.
- (2) Set the horizontal feeding amount of the top feed dog to approx. 3 mm.
- (3) Set the top feed dog at the most highest position by turning the pulley.
- (4) Loosen the setscrew A on the top feed vertical arm.
- (5) Adjust the rising dimension D with the roller B on the top feed vertical arm pushing the bell crank C, so that it becomes the dimensions as follows:

In case of the pusher type top feed dog	3.0 mm
In case of the puller type top feed dog	1.6 mm

- (6) Tighten the setscrew A securely after adjusting.

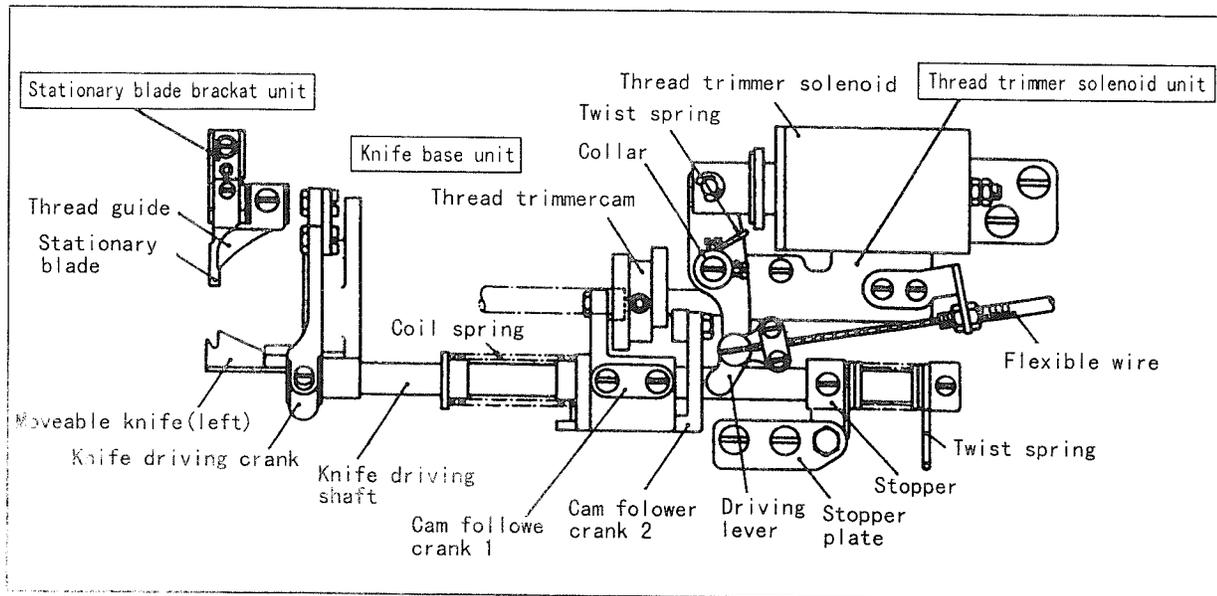

## 24) Adjustment of top feed arm and top feed lever

- (1) Set the drop feed dial A to "0".
- (2) Adjust the dimension B to 6.5 mm or more by turning the top feed dial.
- (3) Loosen the setscrew C on the top feed arm.
- (4) Adjust the link E up and down so that the shouldered pin D will be arranged sideways.
- (5) Align the top feed indicator F on the top feed lever with the zero point on the top feed scale plate.
- (6) Tighten the setscrew C on the top feed arm securely.

## 25) Adjustment of thread trimmer mechanism

- (1) Construction of thread trimmer mechanism

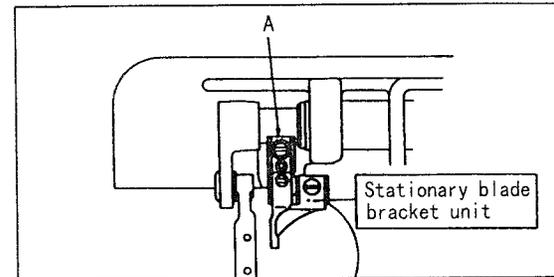

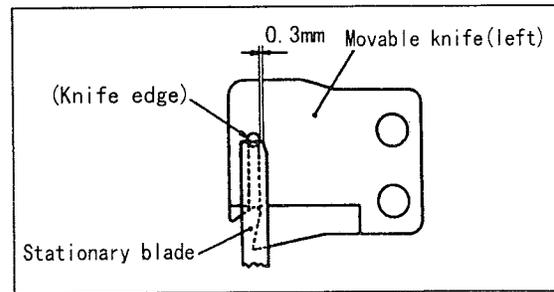

- (2) Precautions during adjustment

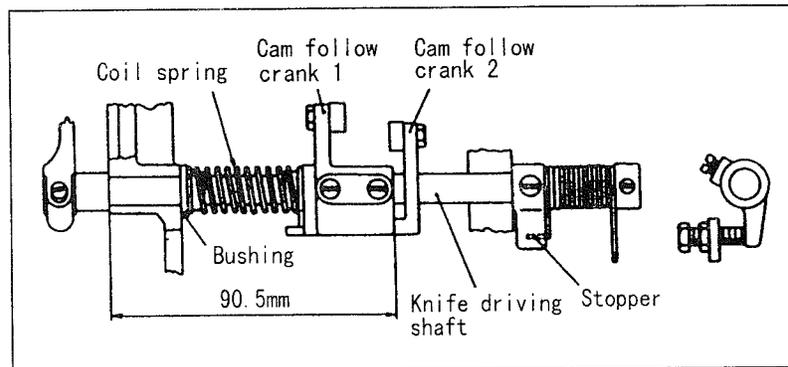

A hook shaft cam method is utilized for the thread trimmer drive. Accordingly, the moveable knife (left) will hit the needle resulting in damage, when rotating the machine by one revolution with the thread trimmer solenoid activated (i.e. with the roller on the cam follower crank 2 engaged with the thread trimmer cam), during the machine adjustment.

(from lower position to upper position) is operating.

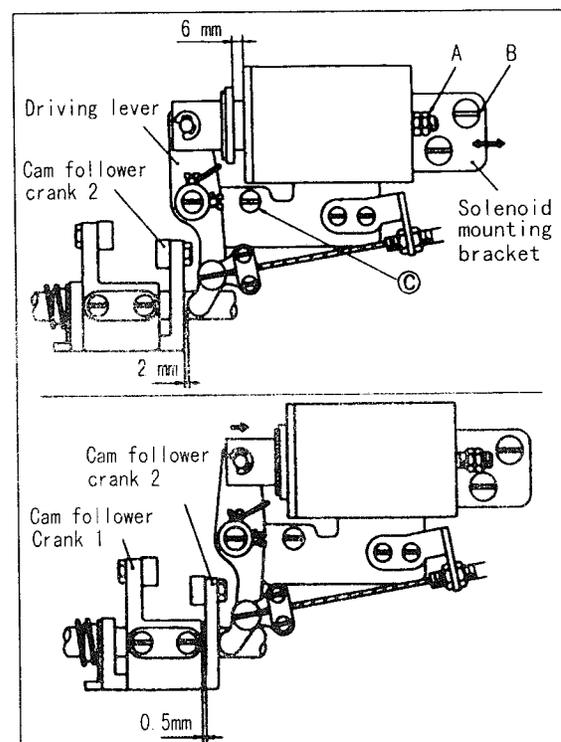

- (3) Relation between stationary blade and movable knife(left) edge
- The standard relative position is shown in the figure.
  - If the dimension (0.3 mm) as shown in the figure is too wide, a "triple" thread cutting off may occur causing the upper thread coming out of the needle after the trimming. If the dimension is too narrow, this situation may cause, also, the thread trimming failure. It is, therefore, desired to pay attention to this dimension.
  - The adjustment described in Step (2) is to be conducted when installing the stationary blade bracket unit or the stationary blade.
  - The stationary blade bracket unit is installed with the screw A under the bobbin case holder removed as shown in the figure.

- (4) Knife driving shaft
- The standard set position is shown in the figure.
  - The knife driving shaft should be put through the knife driving crank first when assembling.
  - The cam follower crank 1 should be secured on the recess on the knife driving shaft as shown in the figure.
  - The stopper should be secured on the recess in such a way that the knife driving shaft rotates smoothly with no play on the shaft direction.

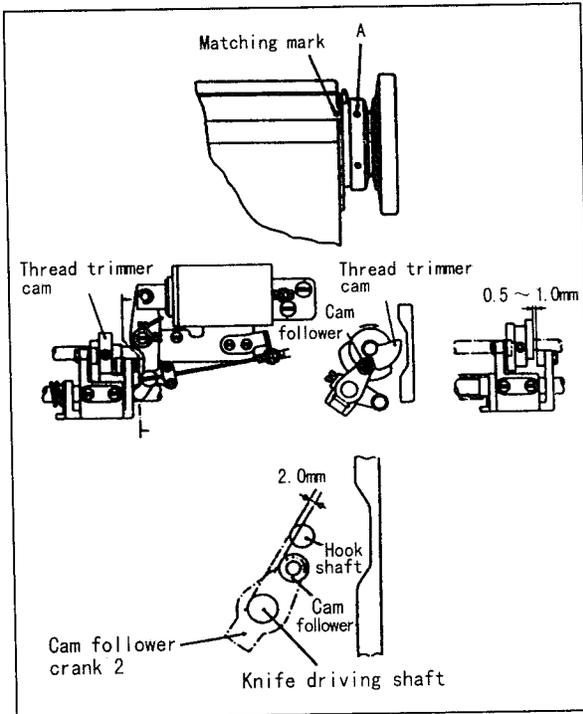

- (5) Thread trimmer solenoid unit installation
- Stroke of thread trimmer solenoid:
    - Standard stroke is 6.0 mm.
    - The adjustment of the stroke is to be conducted by using the nut A.
  - Unit installation:
    - The unit is to be installed by using the screws B and C as shown in the figure.
    - The unit should be installed so that the clearance, between the driving lever and the cam follower crank 2, will be approx. 2.0 mm with the stopper nut A made contact with the solenoid.
    - A possible clearance of 0.5 mm will be created between the cam follower cranks 1 and 2, if the

solenoid is energized in such condition, as shown in the figure. This situation is standard. The adjustment is to be performed by moving the solenoid mounting bracket in the direction of the arrow as shown in the figure.

(6) Thread trimming cam installation

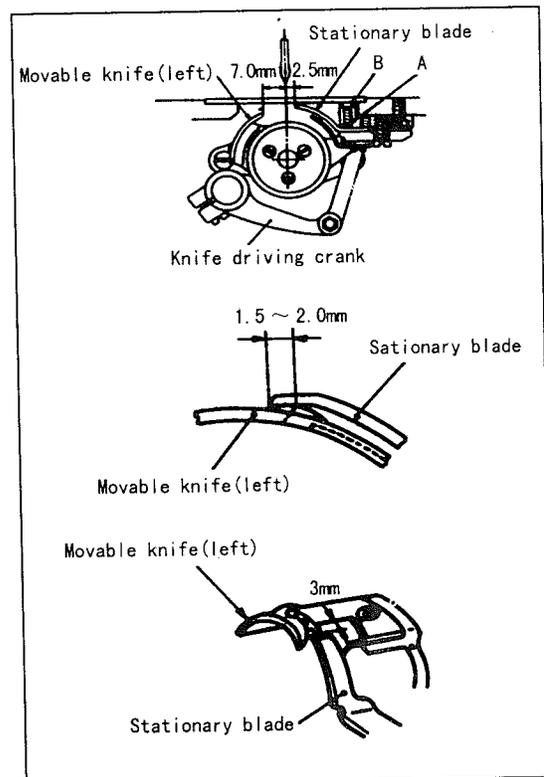

- a. Mate the 2nd timing mark A on the pulley with the matching mark on the arm.
- b. Secure the thread trimmer cam at the point where the cam comes into contact with the roller, by rotating the cam in the direction of normal running with the thread trimmer solenoid energized.
- c. The clearance of 0.5 to 1.0 mm between the cam and the cam follower end is standard with the thread trimmer solenoid released and the cam follower crank 2 restored.

**Caution: The standard position of the cam follower crank 2 prior to the activation is shown in the figure. Perform the adjustment described in Steps (1) through (3) above, after adjustment by using the adjusting bolt on the stopper plate first, when this position is changed in such case of stopper plate removal.**

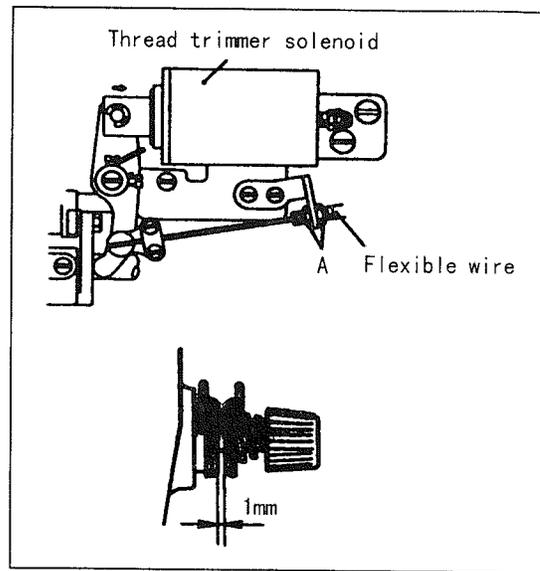

(7) Adjustment of knife engagement

- a. Position of movable knife (left) and stationary blade:
  - ① The distances of 7.0 mm and 2.5 mm from the needle center are standard as shown in the figure.
- b. Adjustment of knife engagement:
  - ① The movable knife (left) will be rotated by the thread trimmer cam, when turning the machine pulley with the solenoid energized. The engagement amount of 1.5 to 2.0 mm is standard, when the movable knife (left) has moved farthest.
  - ② The adjustment is to be conducted with the knife driving shaft installation.
- c. Adjustment of knife engagement pressure:
  - ① The condition, which the movable knife (left) commences to come into contact with the stationary blade, is standard as shown in the figure.
  - ② It is very effective for cutting to increase the engagement pressure slightly, especially in case of dull cutting with thick thread.
  - ③ The adjustment of the knife engagement pressure is to be conducted by loosening the locknut B and using the adjusting screw A as shown in the figure.

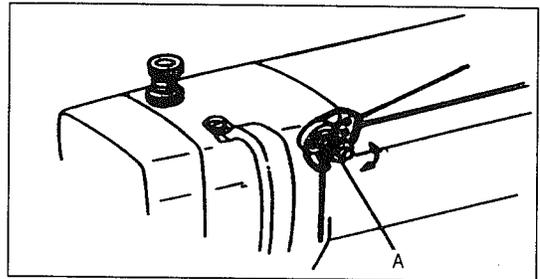

- (8) Adjustment of upper thread tension release
  - a. The upper thread tension release should be adjusted so that the tension discs of the thread tension regulator will open by approx. 1.0 mm with the thread trimmer solenoid energized.
  - b. The adjustment is to be conducted by loosening the nut A and moving the flexible wire as shown in the figure.

**Caution:** If opening of the tension discs are too narrow, the upper thread may be cut shortly causing the upper thread coming out the needle. If the opening are too wide, the space between the discs will be kept always excessive open and may result to the loosing stitch.

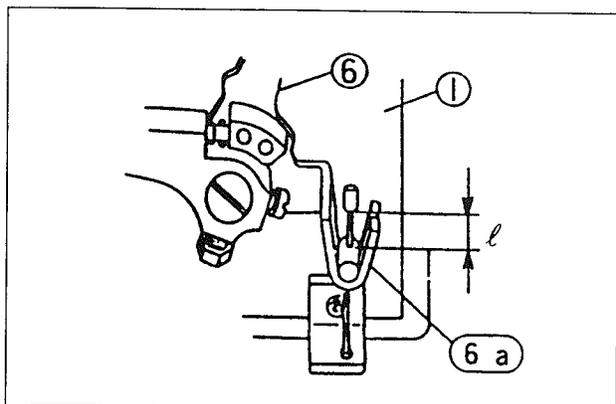

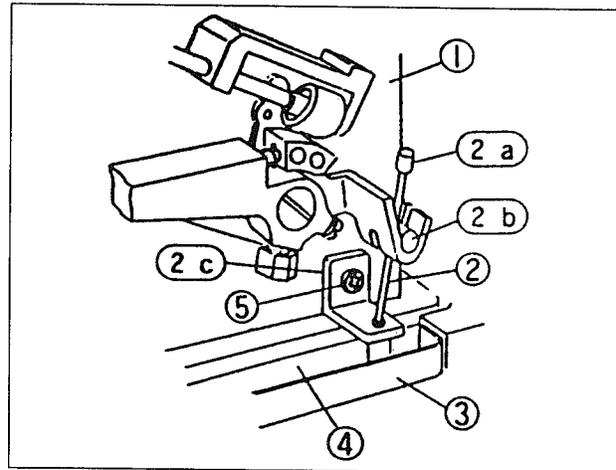

- (9) Adjustment of upper thread tail
  - a. The adjustment of the upper thread tail is to be conducted by using the pretension regulating nut A as follows:  
 Turning clockwise ..... Short tail  
 Turning counterclockwise ..... Long tail

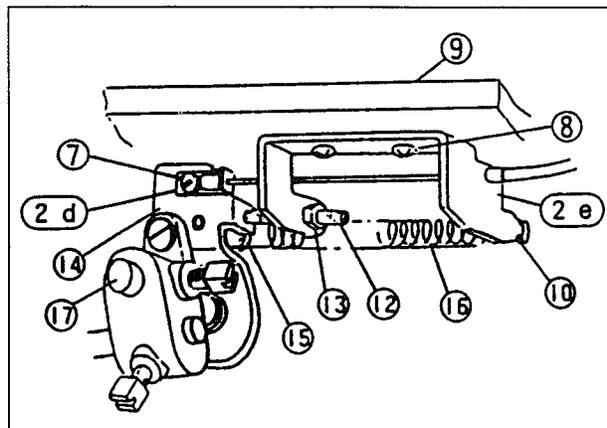

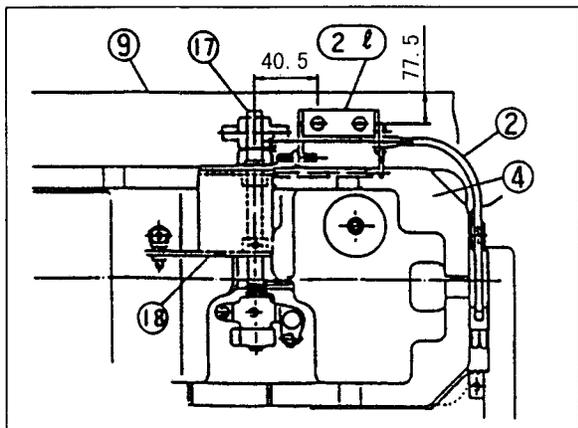

**26) Intermittent ruffling unit installation**

- (1) Installation on the machine head and the table, and the adjustment
  - a. Pass the ruffling wire 2 through the wire tube guide 3 and the oil pan 4 and bring it out of the surface of table.
  - b. Set the arm 1 .
  - c. Fix the wire support plate 2c on the right flank of the arm 1 using a screw 5 .
  - d. Attach the wire terminal 2b to the hook section 6a of top feed lever 6.
  - e. Fix the wire support plate 2e on the rear face of table 9 using a wood screw 8.
  - f. Fix the wire terminal plate 2d on the lever 14 with a screw 7.
  - g. Attach the spring 16 to the pin 15 behind the lever 14 and the spring hook 10 on the wire support plate.
  - h. If the nut 13 is loosened and the stopper 12 is turned to right, the gap between the wire terminal 2b and the wire terminal 2a ( $\ell$ ) is reduced while it is increased with left turns.
  - i. Set the gap  $\ell$  at 3 mm for both the upper and the lower feed so that the gap is

adjusted at 0 when the feed lever is put to the state of reverse sewing.

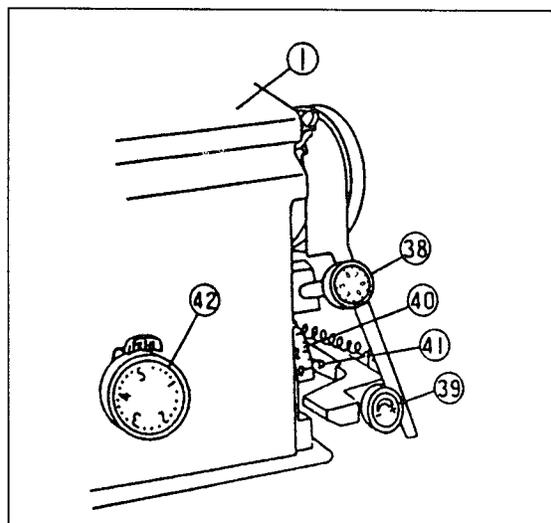

(2) Operating method

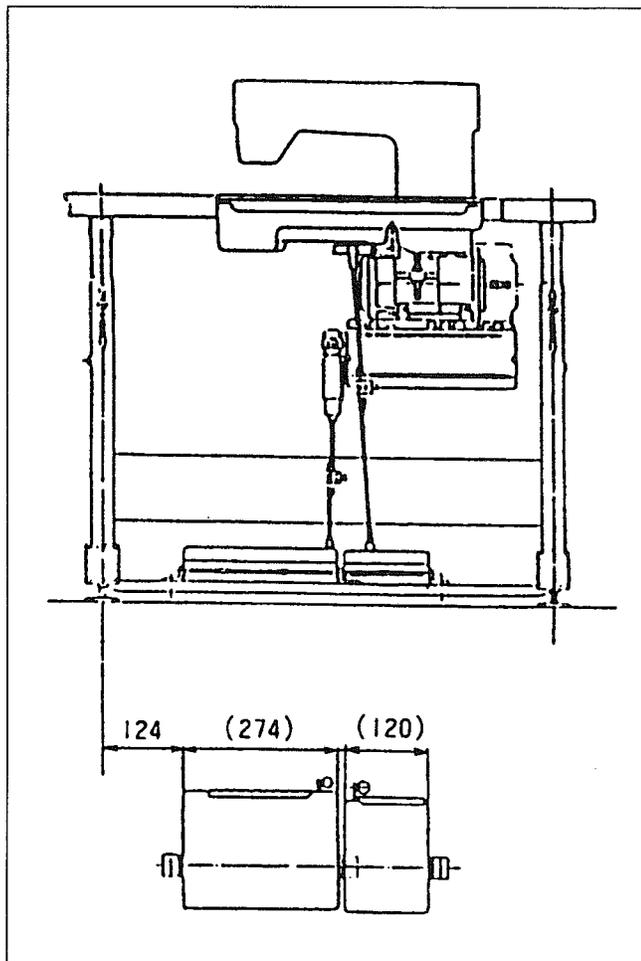

- a. When it comes to the position to make the ruffle sewing, the ruffling sewing can be done by operating the pedal.
- b. As the pedal is reverted, it returns to the ordinary sewing.

(3) Adjustment of ruffling amount

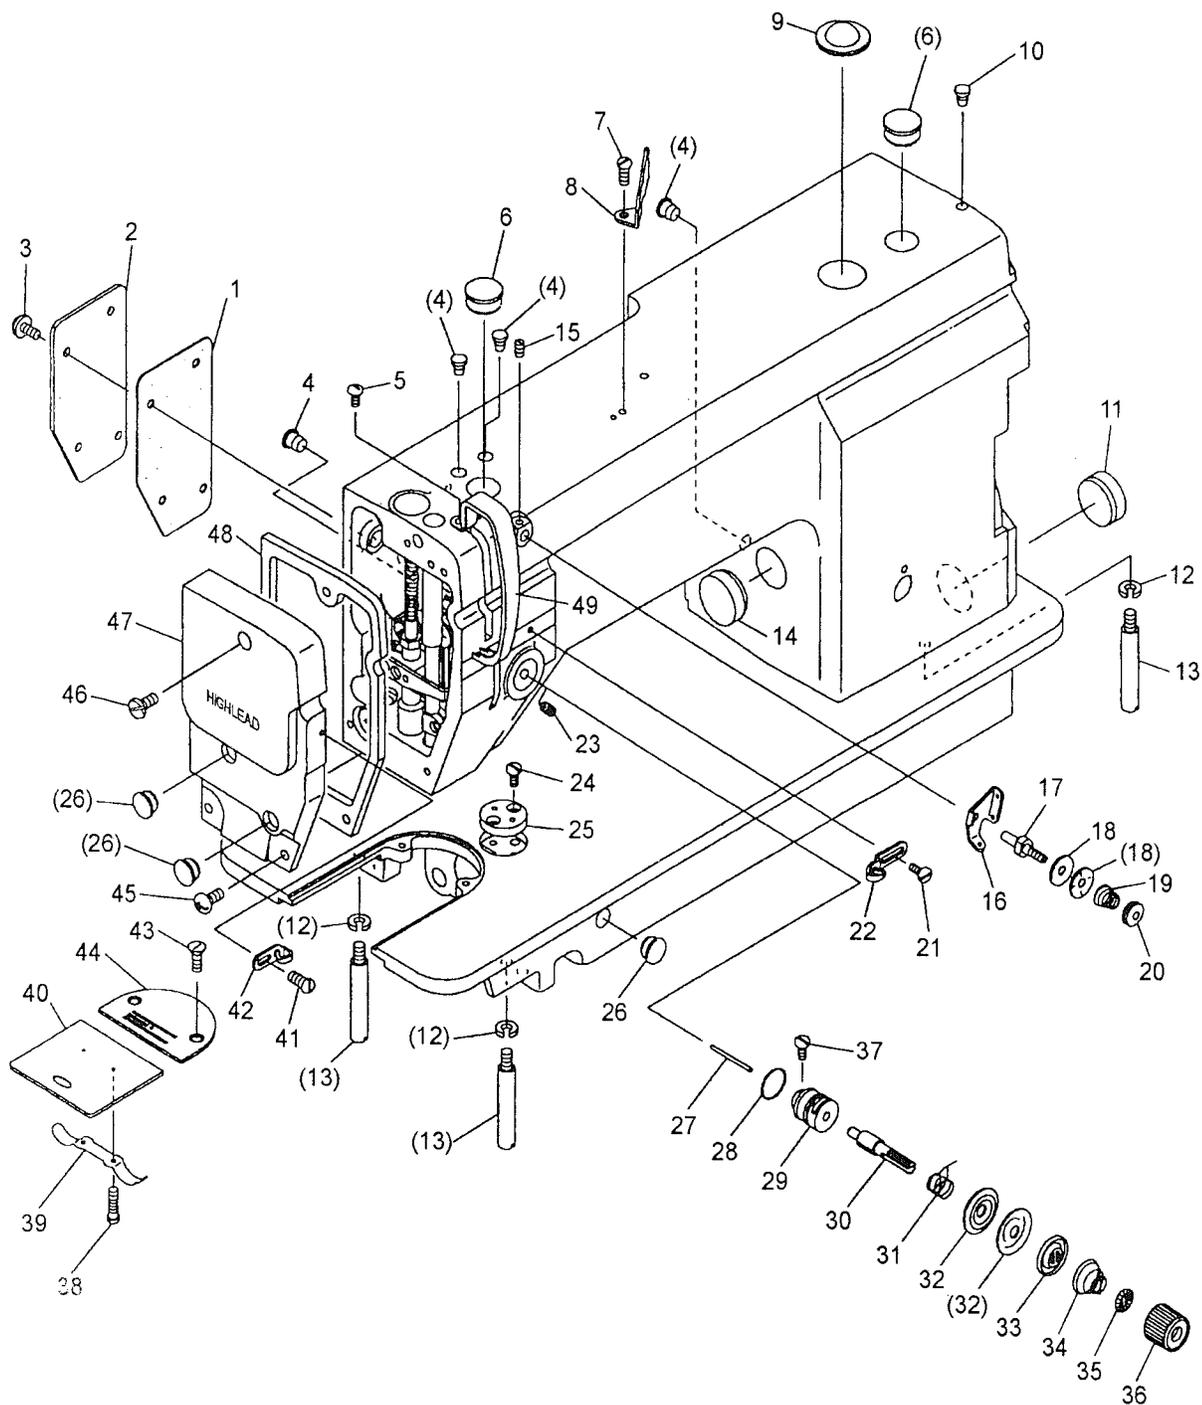

- a. Operate the pedal and confirm the top feeding indicator 41 moves.
- b. The value indicated with the indicator 41 when the pedal is not operated, means the upper feed pitch under the ordinary sewing state.
- c. The value indicated with the indicator 41 when the pedal is fully toed down, means the max. upper feed pitch at the intermittent ruffling sewing.
- d. Max. upper feed pitch at the intermittent ruffling sewing is adjusted by turning the intermittent ruffling stopper dial 38. The pitch is extended with a right turn while it is reduced with a left turn.
- e. To confirm the max. upper feed pitch at the intermittent ruffling sewing, toe down fully the pedal and turn the intermittent ruffling stopper dial 38 watching the value pointed on the scale plate 40.

- (4) Installation of intermittent ruffling pedal  
Install the pedal as shown by the figure.

# A.ARM BED AND ITS ACCESSORIES

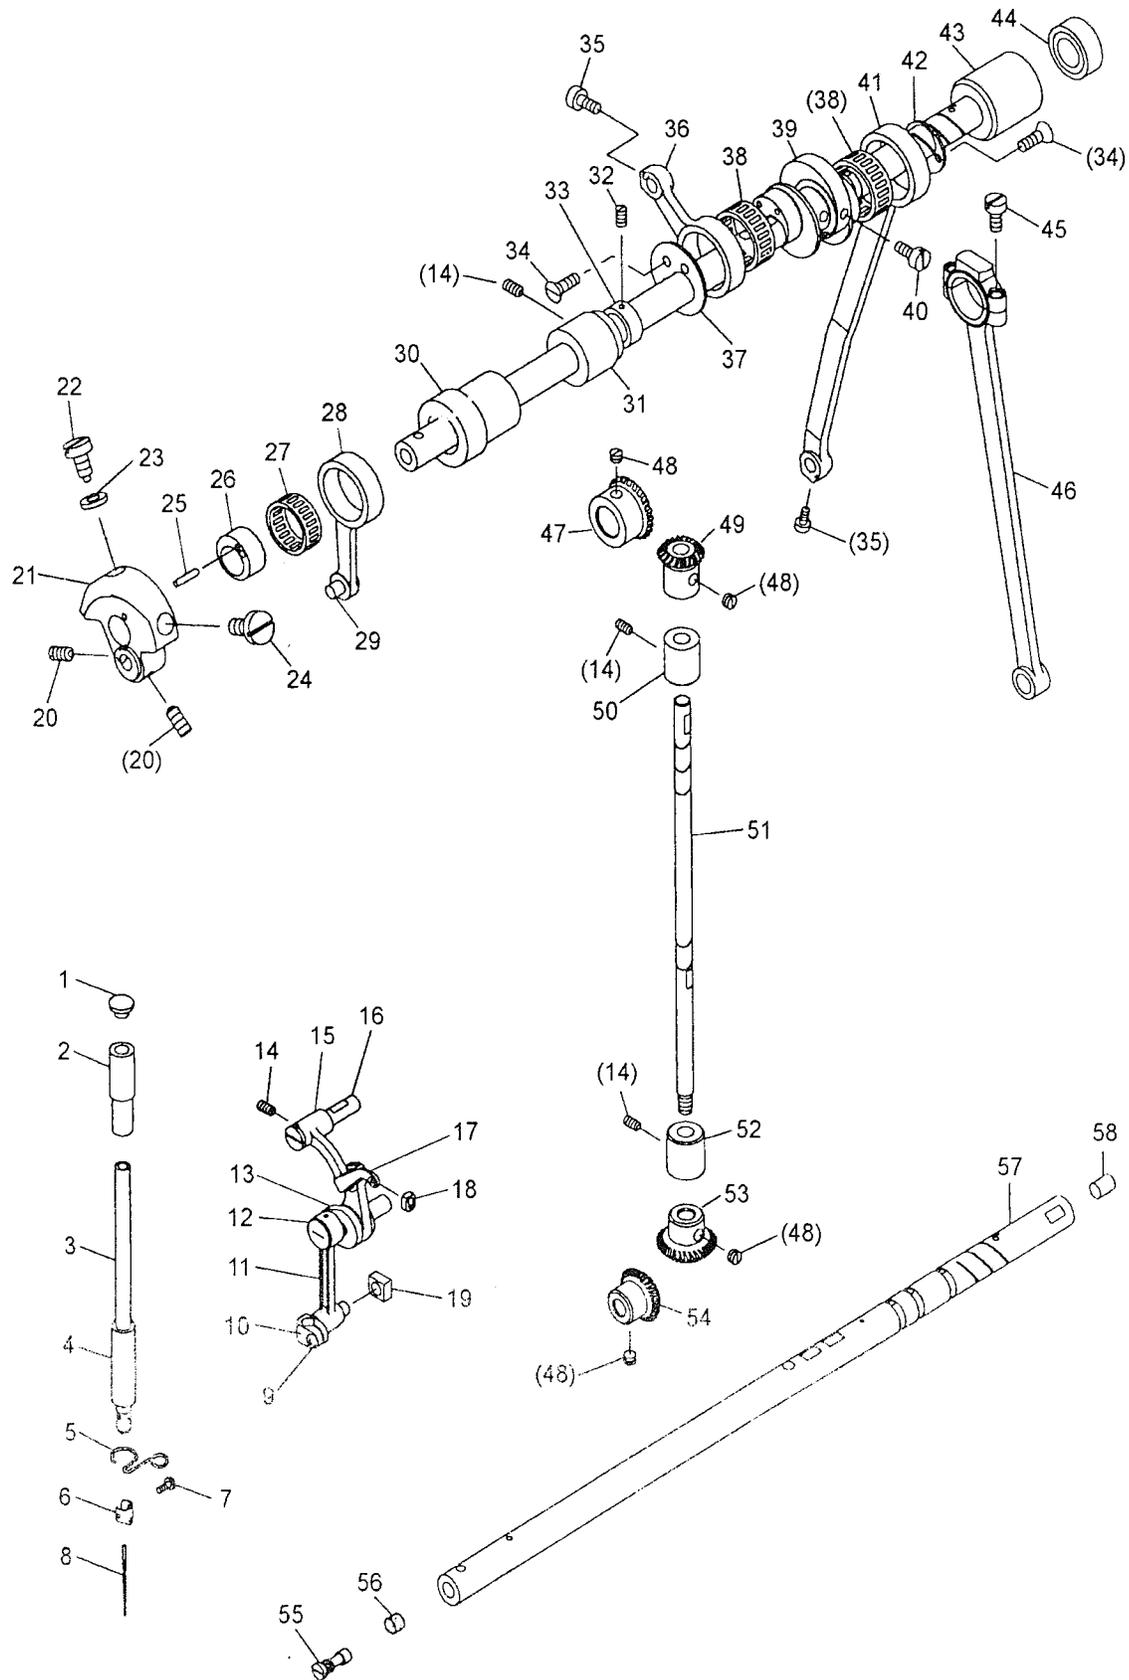

## A.ARM BED AND ITS ACCESSORIES

Fig. No.	Part No.	Description	GC0918-1-D	GC0918-1	Remarks
