

Read before installing
your bathroom sink

PRECAUTIONS

Precautions.

- **IMMEDIATELY REMOVE THE EXCESS OF SILICONE** when it is used to install the drain, as this material reacts negatively with concrete and general stains, which do not imply a low quality of the product.
- **DO NOT PUDDLE:** Concrete sinks should not be puddled with water (or any other substance). This can lead to color changes or staining in the worst case.
- Do not use abrasives, solvents, thinner or vinegar to clean the sink as these can damage the seal layer that protects the product.
* It is recommended to preferably use soaps of neutral PH (such as toilet soap or dish soap) to clean it.
After cleaning the sink, rinse with plenty of water.
- Under no circumstances should the sink be cleaned with a metal sponge as this scratches and damages the protective seal layer of the product.
- If the sink drain becomes clogged for any reason, avoid using chemicals to unclog it and call a plumbing professional instead.
