Install Information for Brake Line Bracket Stud Kit, #BBSK

This kit is designed to replace the factory brake line bracket bolts with studs to allow for easier brake caliper installation and to eliminate the chance of cross threading the holes in the wheel carrier. Included are parts to replace eight bolts. Fits all 996/986/997/987/991 & 981. Depending on the car model, some parts will be not be used.

Use a small amount of the supplied thread locker between the end of each stud and the wheel carrier. Insert the stud deep enough so that one or two threads will be exposed over the top of the nut when the bracket, washer, and nut is installed, as shown below. Tightened nuts to about 4 to 5 ft-lbs.
