Mangroves in Maroalika

Madagascar

Developer: Eden Reforestation Projects

Intervention: Mangrove Regeneration

Proposed Volume: 252,000

Type: Adaptation

Price/tree: £0.17

Overview:

The Eden Reforestation Project in Madagascar simultaneously addresses climate change, biodiversity loss, and sustainable development. The project plants a mixture of four different mangrove trees to re-establish mangrove forests and the numerous benefits they provide to people and the environment. Since it began in 2007, the project has planted over 300 million trees, with a goal to plant 500 million trees each year by the year 2025.

Why we love the project:

 The project utilizes the powerful carbon sequestration potential of mangroves - each tree removes more than 300 kg of CO₂ from the atmosphere over its lifetime!

 Approximately 75% of the species in Madagascar are endemic, meaning they are not found anywhere else in the world.

 The project activities have created more than 3 million workdays for local community members.
