# Seaweed Farming in Cornwall

## United Kingdom

**Developer:** Biome Algae

**Intervention:** Seaweed Farming

**Proposed Volume:** 175

**Type:** Innovation

**Price/tonne:** £36.00

### Overview:

Seaweeds are underwater forests of the ocean that have the potential to provide a clean route for carbon dioxide removal into the ocean sink. Biome Algae is at the forefront of nature-based research and development for seaweed in the UK, working with leading universities and the UK government to quantify the carbon, biodiversity and social impacts of their farm. An innovative venture in their second year, the project is also aligned with industry to support a circular economy.

### Why we love the project:

 The project is committed to supporting the development of a circular economy, including bio-packaging, bio-alternatives to fuel, cattle feed and fertiliser, reducing both carbon & methane emissions.

 Seaweed farming needs no land, fertiliser, freshwater or feed, and it does not produce waste!

 The project will help to create certified methodologies that can help scale the positive impacts of seaweed around the UK and the world.
