

Electric Pizza Bag Usage Guide

If you have any questions or concerns please feel free to contact us.

The rear of the bag contains two pouches.

- The smaller pouch is where the heating plate plug passes through and can also be used to store the car plug.

- The larger pouch is only storage and is designed to store the home plug.

If you are opening the bag for the first time, there will be a white box inside of the bag which contains the home plug. The car plug will be inside of the rear small pouch.

The heating element is inside of the bag under a velcro sealed pouch. It does not need to be removed or cleaned and please do not touch it while the heating element is powered on or is warm.

The female plug that passes through the small pouch can be used with either the car plug or the home plug.

If using the car connector, simply connect the plug to the bag then to the cigarette lighter plug in your car and the light on the cigarette lighter plug will turn on. This indicates the heater is on and warming. The temperature is automatically controlled and there is no on or off switch. Simply unplug the plug from your car to turn off the heating element. The bag will stay warm for some time.

If using the home connector, simply connect the plug to the bag then to the power block, then connect the power block to an outlet in your home or business. A light on the power block will turn on indicating the heater is on and warming. The temperature is automatically controlled and there is no on or off switch. Simply unplug the plug from your wall outlet to turn off the heating element. The bag will stay warm for some time.

The heating element will warm up to about 140 degrees F and uses a built in thermostat to avoid over or under heating.
