

mater

"Every material we use is a tribute to sustainable thinking"

Founded in Copenhagen in 2006, Mater was created to be the pioneering global brand with sustainability embedded in its core.

Circular Materials

All products made with Mater Circular material can be recycled & made into new furniture. The products are created with easy disassembly and chair seats can be recycled into new products up to 5 times.

Mater have developed a patented material – Matek. Matek allows Mater to capture carbon in their furniture by recycling waste into timeless classics using resources already available to us, either post-consumer waste or post-industrial waste available through collaborations with large-scale corporations.

The material combines fibre with a binder. Coffee bean shells, extracted during the roasting process, are an example of fibre material. Sawdust from wood production is another. The binder material is made from plastic waste or a plastic-based alternative.

Mater's wood products are FSC certified, ensuring sustainable felling of the world's forests - each time a tree is harvested, a new one is planted.
