

MEGA-S SULPHUR SPECIFICATIONS

Richfield's Mega-S Sulphur is a water degradable, free flowing sulfur in pastille form. **Richfield's Mega-S Sulphur** has been produced to be applied both directly to sulphur deficient areas as well as being sized for blending with MAP, KCL, or solid NPK formulation fertilizers. When it is applied, the soil moisture will interact with our top-quality Muldoon Minerals bentonite to quickly break down the elemental **S** to very fine particle size, which will more rapidly convert to plant-available sulphate (SO₄).

Our material is made to provide high test **S** in a physical form that is quickly available to plants, as well as providing continuous sulphate (SO₄) production and release throughout the growing cycle.

GUARANTEED ANALYSIS : 90% SULPHUR

PHYSICAL PROPERTIES

Color	Pale Copper Pastilles
Grade	Agricultural
Fertilizer Prill Size	260SGN
Angle of Repose	29 Degrees
Breakage Tests (% Fines Produces)	<0.5%
Impact (SLI)	0.9%
Abrasion (SLI)	0.7%
Package Sizing	1 ton big bag

Richfield was formed to produce sulphur bentonite fertilizer of the highest quality, close to the production facilities of both sulphur and bentonite clay.

The founders of Richfield have years of experience distributing sulphur bentonite fertilizers and were able to observe first-hand the difference that a high quality sulphur product can make to your crop yields. We want to help you to unlock the yield potential that sulphur deficiency steals from your crops.
