Effective Open Space Bird Control

Action

Eagle Eye is an optical bird scarer that actually works. Birds become disoriented and irritated by the reflected light beams that flash at various angles from the rotating Eagle Eye units. The light bands, including ultraviolet and infrared bands, are reflected back to the bird imitating the presence of a predator bird. This causes the bird to deviate in flight and fly to another destination. It does not affect sitting birds but hinders the bird at the angle which they come in to land at their destination. Once chased away from their sitting position the bird will eventually not return to where the Eagle Eye is installed.

Protection

- Open spaces
- Agriculture
- Large expanses
- Roofs
- Commercial, Industrial, Residential

Description

The Eagle Eye is fitted with a 12 volt DC motor to make it turn at a specific speed, reflecting the light beams at constant intervals. It can be powered by making use of a 12-volt transformer, a Solar Panel or a 12 volt battery. A time switch can also be used to switch the Eagle Eye on and off as required.

The Eagle Eye functions optimally in direct sunlight. Artificial light can be used for indoor applications or shady areas but is not as effective as direct sunlight and more units will be needed to cover the same area. (A specific light type is required.)

The reflective surface of the Eagle Eye is manufactured from strong ABS plastics and will not break even during hailstorms. Animal welfare institutions are in favour of the Eagle Eye because it is environmentally friendly, not harmful to any animals or the environment.

Fitting

An important aspect of the Eagle Eye is that it works in line of sight. If there are obstacles in the way of the beams, more units will be needed to cover the specified areas on the different height levels. Installation trials should run for at least 3 months, after which bird infestation will be reduced by up to 80%.

A wide range of fittings are available to enable use in all situations.

Whilst we recommend use with mains electricity, solar versions are also available.

The Eagle Eye bird chaser is the most effective open area bird deterrent in the world today.

Eagle Eye is a complementary component in the Avithor range of products and techniques for pest bird management. It is particularly suited to management in open areas where other options cannot be considered. Correct placement and installation is relatively easy.

Avithor Eagle Eye has proven to be effective for significantly reducing pest bird numbers and bats in a variety of applications including, commercial buildings, industrial buildings, airstrips and agricultural situations.

Once the unit has been in use long enough to change the birds perching and roosting patterns, then sporadic overcast weather will not influence the effectiveness. The units do require periodic maintenance including cleaning to ensure their effectiveness.
