

## PREPARATION OF BRICKWORK FOR INSTALLATION OF NOVITHOR™ TERMITE PROOFING RESIN

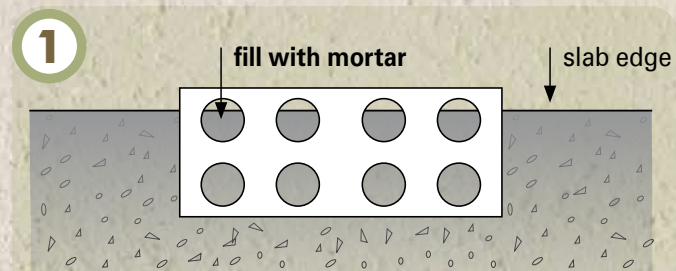

NOVITHOR Termite Proofing Resin is a termite proofing liquid designed to create a physical (pesticide free) termite protection system to protect against ingress by subterranean termites.

It is applied to mortar or render where it soaks in to the mortar joints and hardens the mortar so it becomes like granite to stop attack by termites.

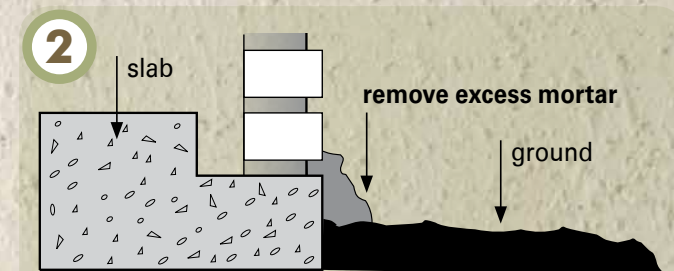

On its own, NOVITHOR Termite Proofing Resin is not termite proof, it works with the mortar.

**To allow for its success the following conditions need to be met:**

- It is critical that all mortar joints are full with no gaps. If there are gaps in the mortar the termite protection will not be effective.
- Extruded bricks with core holes that hang over the external slab edge must have the outside core holes filled with mortar. ①
- Excess mortar dropped during brick laying must be cleared from the base of the wall to allow installation of NOVITHOR Termite Proofing Resin. ②

Overhanging brickwork with mortar fill correctly applied to the outside core holes.

Excess mortar dropped during brick laying must be cleared from the base of the wall to allow installation.
